If you're gonna cross.. ..better start doing it right.

4374. Function key, ASCII equivalent?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-06 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6ip2lgoae1@newsd-199.bryant.webtv.net>
Source record: 63187

About the function key equivalent, what would be the ASCII code for a function keypress? Is the IBM keypress higher than the range of ATASCII? i.e. the "A" key is an ASCII 65, is a function key like 425 or something?

4375. Ape/Ram Disk

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-06 00:00:00 UTC
From: Bob Reynolds <bober@kcbbs.gen.nz>
Message-ID: <3550235E.3E963514@kcbbs.gen.nz>
Source record: 63188

I have recently obtained Ape and would like to continue using the PSI Ram Disk Handler (by Nathan Hartwell) to utilise the 320k in my 130XE as D8.
Unfortunately the X32G.DOS with Ape won,t work with PSI. and I prefer Spartados to Mydos (a suggested alternative).
Has anyone using Ape found a way to use a Ram disk with X32G.DOS.
Thanks.

4376. Re: diskette/cartridge copy protection

File Formats
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?
9.2) What is an .arc file?
9.3) What are the .DCM, .ATR, and .XFD file formats?
9.4) What are the .XMO and .BIN file formats?
9.5) How can I make my commercial boot disk (tape, cart) into a load file
or disk image?
9.6) How can I convert my commercial boot tape into a cassette image file?

File Transfer Solutions
11.1) What are the best terminal emulators available?
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?
11.3) Can I read/write MS-DOS disks on an 8-bit Atari?
11.4) How do I transfer files using a null modem cable?
11.5) What is SIO2PC?

Peripherals
12.1) What 5.25" floppy disk drives are available?
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?
12.3) What do I need to connect a hard drive to my 8-bit Atari?
12.4) What kinds of monitors can I use with my Atari?

General Interest
13.1) What's the best DOS for the Atari?
13.2) What hardware has Atari created in the 8-bit computer line?
13.3) What are the power-supply requirements for my Atari components?
13.4) What are the pinouts for the...?
13.5) What BBS software can be used on the Atari?
13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?
13.7) Which versions of the Operating System (OS) are there?
13.8) What games support 4 simultaneous players on the 400/800?
13.9) Why should I disconnect the 810/1050 power supply before connecting or
disconnecting SIO cables?
13.10) What is Omnimon?
13.11) What is the difference between NTSC and PAL machines?
13.12) Is the software for the Atari 8-bit computers "TV-standard dependent?"
13.13) What programming languages are available for the Atari?
13.14) What is the Atari XEP80 Interface Module?
13.15) What makes some XL/XE software incompatible with the 400/800?
13.16) What games run only on the 400 and 800 models?
13.17) How do I type a tilde (common character in Web URL's) on my Atari?

Other FAQ Lists for the 8-bit Atari
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) I'm new to the Atari. How do I use this thing?
14.5) Can I use an emulator to run my old Atari software on my new computer?
14.6) What hardware upgrades, modifications and add-ons are available?
14.7) What is the HARD-Interlacing-Picture (HIP) format?
14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

Reader-suggested topics, unwritten as yet: (volunteers?!)
How fast of a modem can my Atari display keep up with?
-with UltraSpeed roms?
-with XEP-80
-with any particular terminal program

Video Upgrades
-Adding chroma\lumi to 800XL

What is APE?

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA

Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance

in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing direct memory access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Today Atari Games is an indirect, wholly-owned subsidiary of the Midway Games division of WMS Industries.

Atari Games Corp.: http://www.atarigames.com/
Midway Games, Inc.: http://www.midway.com/
WMS Industries, Inc.: http://www.wms.com/
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of direct memory access. European 65XE's include the ECI port.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and
supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. (AMEX:HAS). Hasbro Interactive has expanded its charter to include original and licensed games for the PC, the Sony PlayStation(tm) and for multi-player gaming over the Internet. Headquartered in Beverly, Massachusetts, Hasbro Interactive has offices in the U.K., France, Germany, Japan and Canada.

Hasbro, Inc.: http://www.hasbro.com/

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer...

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
60 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Display Type	Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12 ++	Char	40 x 24	5
5	13 ++	Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14 ++	Map	160 x 192	2
D	7	Map	160 x 96	4
E	15 ++	Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9 +	Map	80 x 192	1 **
F	10 +	Map	80 x 192	9
F	11 +	Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls

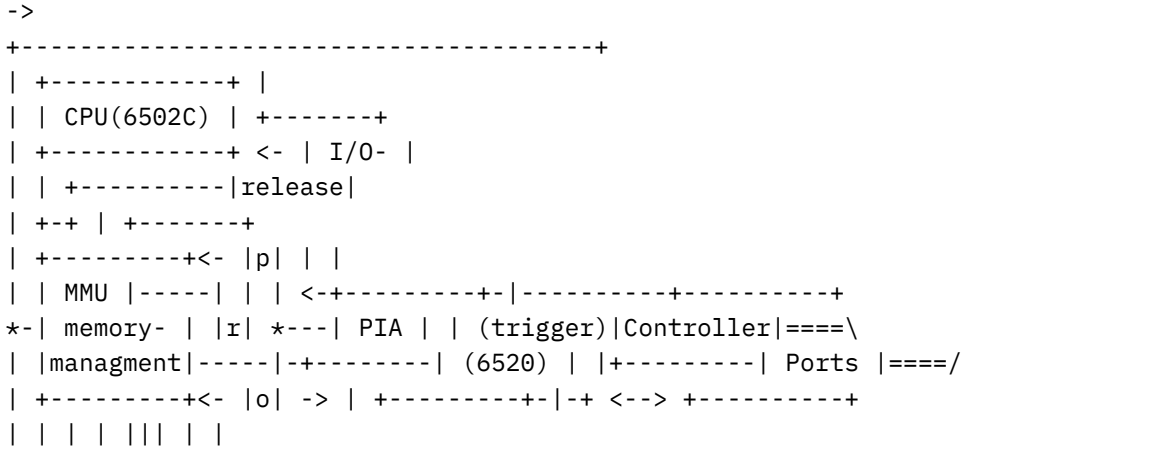
most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

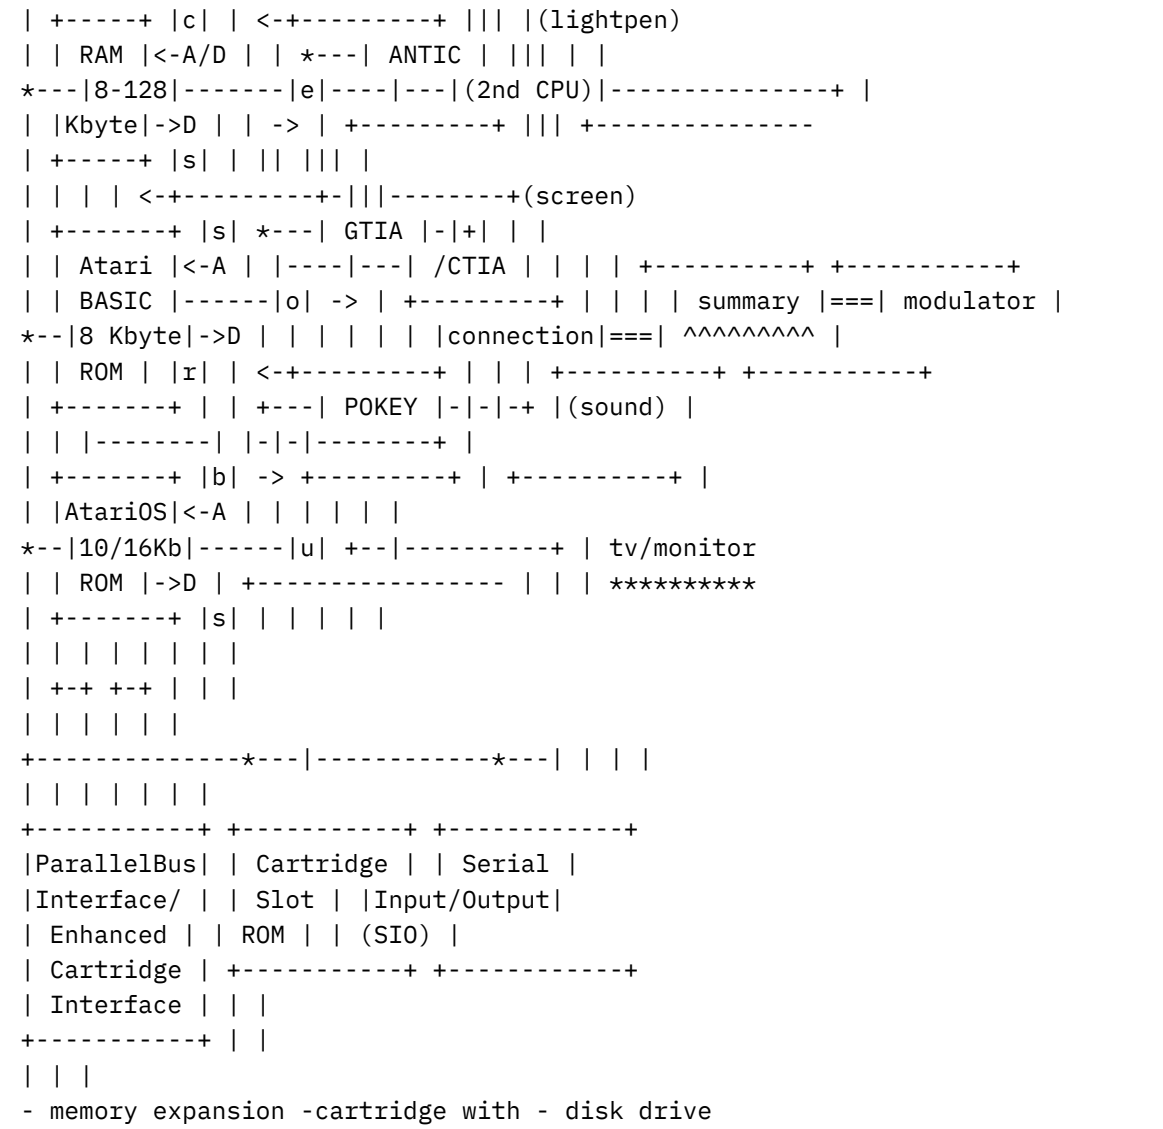
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.sb.sub.de (Peter))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800:8/16/48K,1200XL/800XL/65XE/800XE/XEGS:64K,600XL:16K,130XE:128K
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a

similar meaning to the English word "check", and "Hanne", an
acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the
Californian Secretary of State, which approved "Atari". The rest is
history.

When the company name changed, Bushnell and Dabney decided to update the
logo too. They incorporated the "S" from Syzygy and the "A" from Atari
into the new design, and if you look at the middle logo [MLOGO2.BMP], you
will be able to make out both letters.

It was not until later, as the company became increasingly successful, that
an advertising agency designed the slicker and now famous Atari logo - the
"fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion
about the Atari 8-bit family of computers, including the 400, 800, 1200XL,
600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like
comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use
alt.binaries.atari and alt.binaries.atari.d or upload the software to the
University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit,
presumably because the custom of drafting charters for new newsgroups did not
exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Atari related hard/software announcements. (Moderated). Dead newsgroup?
Moderated by Yat Siu, mailto:lexicor@world.std.com

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.1) What is INFO-ATARI8?

INFO-ATARI8 is an e-mail list for discussion about the Atari 8-bit family of computers.

To subscribe to INFO-ATARI8, send a message to:
mailto:listserv@vm.marist.edu
that says:
subscribe info-atari8

Owner= HARRY@MARIST (A Harry Williams)

comp.sys.atari.8bit postings no longer appear in INFO-ATARI8.

INFO-ATARI8 was created on December 9, 1986.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

atari8-l mailing list

created especially for discussion about ANIX project (unix for atari8), but any atari 8bit related threads are welcome. english language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

there is also mail2news gateway that translates all postings on the
list to easy to read usenet articles, available read-only to everyone at:
news://zwieracz.pse.pl/listserv.atari8-l

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by
mailto:kendrick@zippy.sonoma.edu (Bill Kendrick), designed to provide much-
improved access to the various PD/freeware/shareware Atari 8-bit software
archives available on the Internet.

XL Search is located at: http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

You can also access XL Search via e-mail! Send mail to:
mailto:kendrick@zippy.sonoma.edu with the subject "xlsearch" for details.

mailto:kendrick@zippy.sonoma.edu (William Kendrick) himself writes:

http://shareware.com/ , c|net's FTP-site search engine, now includes
the Atari 8-bit files at UMich!

Unfortunately, being under the previously-existing "Atari" category,
the files are now pretty mixed in with the ST stuff. I've talked to them
about fixing that. No reponse yet (they're really slow that way)...

Anyway, so now you can use http://shareware.com/ to find Atari stuff..
just be careful what directory you pull it out of! :)

Remember, you can ALSO use MY MINI VERSION OF SHAREWARE.COM!....

XL Search, the Atari 8-bit FTP site search engine!
If anything, it's much less cluttered than Shareware.com! ;)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. For more information:

Bill Kendrick, mailto:kendrick@zippy.sonoma.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich Archive. The Archivists request you use these mechanisms in this order of preference:

1) The number one way to get into the UMich archives is via AFS. If you have AFS, all our files are kept in the directory "/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT! Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/ Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory. Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/

ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://ftp.toad.net/pub/umich/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You might also suggest what permanent 8bit subdirectory you'd like your file to end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no (Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate directory. Please include a readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some
comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

The Cleveland Free-Net now has a home page:
http://cnswww.cns.cwru.edu/net/easy/fn/

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British
Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.......

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc

Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:76702.1076@compuserve.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load
file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot
disk and making an atr, xfd, dcm or other disk image type
file out of it, usually for use with an emulator. Before
emulators, the Bob Puff .dcm format was used to
store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large

number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are
a sector editor and disassembler. Carts are usually most
easily dumped using a special OS, like Omnimon, to interrupt
the cart and dump memory to disk. There are a few pd cart
copiers that have the user plug the cart in when the program
is running, I don't believe these pd cart copiers are very
good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy
protected commercial software' is don't bother. Find it on
the net.

There is one exception, in that this 'solution' involves a
minimum of effort and is relatively safe. I refer to
'Chipmunk' and 'Black Patch' software to make cracked boot
disk copy of commercial disks. HOWEVER, even if you use
these two commercial archival tools, be sure you write
protect your originals, and be careful not to accidentally
write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product.
The APE Pro system, by Steven Tucker, in the registered
version of this shareware allows making disk images called
'Pro' images. APE (Atari Peripheral Emulator) requires a
cable, called the SIO2PC cable, that connects the A8 13 pin
serial port to a serial port on the IBM PC clone. To make
'Pro' images, a special adapter cable is needed, not just
the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the

data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.geocities.com/Hollywood/Lot/4205/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None

Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning

300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050 drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the

confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 11.5) What is SIO2PC?

Original text by Dave Paterson, mailto:davepat@total.net

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la
K-Products
US Doubler).

All these functions are transparent at the Atari end; you never notice the
difference between SIO2PC and regular drives, except that the SIO2PC drives
are faster than any others (except Ramdisks and PBI interface drives).

Several different designs for the SIO2PC hardware are floating around. Best
contact the author for the latest details.

SIO2PC 4.16 is shareware by Nick Kennedy, mailto:nkennedy@cswnet.com

work better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

==> Percom AT88-Sy[PD]
where: y=1 -> a single-drive unit
y=2 -> a dual-drive unit
PD -> equipped with a built-in parallel printer port

==> Trak ATD1
SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:

- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB

Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps

Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)

Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps

Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README

Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- UltraSpeed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the

XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (76702.1076@compuserve.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors

o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch
Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus
separate chroma (color) and luminance (brightness) signals which the best
composite video monitors can take advantage of. Popular examples of such
monitors include the family of monitors produced by Commodore.

The pinout of the Monitor port is in the pinout section of this FAQ list.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the 800XL lacks separate chroma/lumi (can be added via hardware modification)

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\lumi signals

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is probably the Commodore 1702 which has a very good picture and is quite reliable.

If you plan to use an XL (which I do), upgrading the video circuitry makes as big a difference as what monitor you choose. Ben Poehland has some excellent articles in Atari Classics magazines for improving the quality of the XL's video, as well as restoring the missing Chroma output."

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4,

uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is available in a 16K ROM cartridge from Video 61 (see compantion Vendor List).

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI (Europe: includes ECI)
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I software
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors

mailto:rrs0059@ibm.net (Frank McKenney) writes:
The printer/plotter mechanism for the Atari 1020 is
(I believe) the same one used in the Tandy/Radio
Shack CGP series and the Commodore 1520(?), and
was
made by a company named ALPS.

1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of

the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

o Carina BBS -- a product of Shadow Software. See Vendor list to contact.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:offen300@hio.tem.nhl.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:offen300@hio.tem.nhl.nl

The following Operating Systems exist for the Atari 8-bit:

Rev. System(s) Models Size Part Nr(s)
~~~~~~ ~~~~~~~~~~ ~~~~~~~~~ ~~~~~~ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
A NTSC 400/800 10kB CO12499B, CO14599B, 12399B (*)
A PAL 400/800 10kB CO15199, CO15299, CO12399B
B NTSC 400/800 10kB (?)
B PAL 400/800 10kB (?) (*)
1 A NTSC/PAL 1200XL 16kB CO60616A, CO60617A
1 B NTSC/PAL 1200XL 16kB CO60616B, CO60617B (?) (*)
1 NTSC/PAL 600XL 16kB CO62024
2 NTSC/PAL XL/XE 16kB CO61598B
3 NTSC/PAL XE 16kB C300717
4 NTSC/PAL XEGS 16kB C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:sposey@ioa.com (Steven E. Posey) (Party Quiz controllers description)

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a
box with
2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before
connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines,
but software designed on PAL machines (Europe) won't necessarily work on
NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines
displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they
refresh the screen 50 times a second doing 1/2 the lines each refresh
so they effectively repaint the screen 25 times a second. NTSC is
525 lines/screen with a 60 times a second refresh - again only half
the lines each refresh so a 30 times a second frame rate. This
would change the amount of time available during vertical sync pulse,
and the number of lines that need to be redrawn each time.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard
dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, email-to: offen300@hio.tem.nhl.nl
==
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]

Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]
Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).
- 6502 Cross-Assembler "xa", 1997 (Andre Fachat) [D]
written in GNU C.

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]

- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all

of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Subject: 13.17) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

4379. Re: Function key, ASCII equivalent?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-06 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <01bd78e6$b10a5ee0$62c2accf@asharkis.erols.com>
Source record: 63192

I won't swear to it, but I believe that IBM Fn keys map to whatever the application running at the time dictates. For example, in MS-DOS, F1 allows you to recall to the screen the last command you typed, letter by letter. In GWBASIC, F1 produces the keyword, "LIST." In many, but not all, applications, F1 is a Help Key.

May I suggest....

Search the net for information on DEC VT100 terminal specs. Try and
get documentation on the VT100 keyboard and ASCII or ANSI values
corresponding to the various keys on a real VT100 terminal. Once you
know those values the battle is half or more won. I'm sure you can
figure out the rest once you have that.

What computer is it for ? XEGS ? 800 ? I think the XL's, XE's, XEGS all use
the same PSU, but not quite sure. At least my 130XE PSU works with the
800XL and vice versa. The 800/400 use the same as the 1050 drive

4385. 800XL video upgrade?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-06 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.3.96b.980506092727.13956A-100000@becker1.u.washington.edu>
Source record: 63198

The recently posted FAQ says:

"the 800XL lacks separate chroma/lumi (can be added via hardware
modification)"

It also mentions an Atari Classics magazine article and a Hardware/Upgrade
FAQ, but I can't find an actual procedure to do this upgrade. Where is it?
What does it involve?

Any/all help greatly appreciated!

>the Commodore's were superb low cost cut down clones of the Atari's

Ah, the experts speak!

If you have any interest in the actual (as opposed to "made up at user group meetings") technical features of the two machines, I have placed my Atari/C-64 technical list at

http://stratus.esam.nwu.edu/~judd/fridge/

I am quite receptive to comments, at least those beyond the "Yeah, but it's easier to format disks on the Atari!" level. (Ah, if only Atari marketing had been able to capitalize on the disk formatting issue...)

>(I've just recently had the pleasure of meeting with the 3 men
>who designed the Vic-20 and C64 and they explained that those systems
>were exactly that, low cost cut back clones of the Atari 8-bits),

How very interesting. Would you care to give the names of these three men, and the circumstances under which you met them?

Note that you can read some comments from the actual designers in an article in the March 1985 issue of IEEE Spectrum.

>but
>they're cost combined with a large media push put the C64's ontop, its
>amazing what people will buy :)

It's amazing what some people will believe, eh? :)

4392. Re: Z-Machine Interpreter For Infocom Style Games

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-06 00:00:00 UTC
From: stevenposey@usa.net
Message-ID: <3550a8b3.93539043@news.ioa.com>
Source record: 63205

I got an e-mail message from Tom Hunt yesterday about this. He says
he's done it already, and some of the files he's converted can be
found at:
ftp://closertohome.dyn.ml.org/ftp/pub/Atari_8bit/More_Atari8bit/CTH_SHAREWAR
I'm waiting to hear from him if he'll tell me how he did it.

You're right about the version 3 problem. Starting with A Mind
Forever Voyaging, a version 4 game, Infocom seemed to drop all support
for the 8-bit Atari. It was circa 1985, and the ST machines were
starting to draw all of the attention. Even the 130XE wasn't enough
of a machine to support their revised interpreter. Rather than try to
accomodate the 8-bits, they just dropped them from the line :-(

I plan on using Inform to compile all of my stuff in version 3 format
if I can work out the interpreter problem. Tom says he's made v3
disks for Alice, Adventure, Mini Zork, MST3K, Odieus, Paperchase, and
Toyshop, and only had to change a line or two of the source files to
get them to compile. Hopefully, some of the other v5 games can be
recompiled to v3 also.

All I really need is a z-interpreter that will autorun and load a data
file. The name of the data file isn't important since you can only
put one game on each disk; something like z3.dat would work. As long
as the interpreter was written to open that file, it wouldn't care
what the game actually was.

Since I'll use my PC to compile the games, then SIO2PC them to the
Atari, I don't need an Inform compiler for the A8, just an
interpreter.

Am I on the right track?
Steven

The F keys must fit in 0-255, but I don't know where. When you type a F key in DOS or something it makes nothing except F5 makes @ F6 makes ^Z F7 makes ^@

ASCII only defines keycodes up to 255. Usually, an OS dependant
interrupt handler deals with extended keys, like F1-F12 on PCs, and
Option, Select, and Start on the Atari.

I've seen a terminal system before that used function key equivalents
by pressing the Escape key first, then pressing the number key that
matches the function key (i.e. Esc+1=F1).

It's worth a shot.

Well, the biggest reason for a lot of this stemmed from the Atari's shortcomings. The SIO port and the device handlers were just an example of how creative the Atari guys were at getting the most out of a small machine. By using a universal, daisy-chaining port, you could hook up all sorts of external devices in sequence and call them with universal routines, which really cut down on the amount of coding that had to be done to the OS. The device handlers (D: C: R: E: K: P: etc.) were what made the whole thing successful. Why write different systems to handle each device, when you can write a general purpose handler for everything? All you had to do was address which device you were speaking to (yes, even the keyboard and screen were considered addressable devices), and then use standard read/write routines to access it so all you had to deal with were the exeptions (i.e. you can't write to the keyboard).

Ingenious? Yes, but at the heart of it was a group of people just trying to figure out how to cram all of that functionality into a little plastic, metal and silicon box.

I don't see any computer designers today working toward that same kind of efficiency. Maybe that's why we all still cling to our 8-bits ;-)

Yes, although I think you're thinking about the data file in the wrong
way. As I recall, on the Atari, Infocom Z3 games are split across two
disk sides (it's only one on the C64 and Apple), so you'll need to find
out how Tom plunked the data file into the disks with the interpreter.

The key is finding out from Tom Hunt how he assembled those Atari
disks...once you get that information, you should be able to compile Z3
games on your PC and play them to your heart's content on the 8-bit.

To simulate the F keys of a terminal, it depends entirely on the terminal
emulation you're using and how that program maps the Atari keyboard to
simulate the terminal. The IBM PC keyboard keycodes will not help you.

There must be some online help or reference table included with the
terminal emulator you are using where you can lookup the keys & how it gets
mapped to terminals.

You would think so, but they aren't. Function keys aren't part of the ASCII definition. They produced those DOS results because they were mapped that way; they're not hard-coded to any ASCII equivalent. They poke memory locations, and the running program reads those locations to know which ones have been pressed, in much the same way that Option, Select and Start are done on the Atari. DOS is no exception; it just happened to produce results that looked like ASCII keypresses.

In Visual Basic, the function keys are addressed simply as {F1} to {F12}, and the compiler is designed to know those memory addresses and act accordingly when they are pressed. The OS itself isn't concerned about function keys. I would suspect that all real compilers like C would behave in much the same way.

The only way I can see that a terminal program on the Atari could mimic the F-keys would be for the program to allow some kind of macro coding that would let you send the relevant POKE command to the remote memory location. Scary thought.

Yeah, for most of the Infocom titles, you're right. They were on 2 sides. A few of them were one-sided, also.

But what I'm talking about wouldn't matter if the disk was an image on a PC and read through SIO2PC, since you can have images that are larger than a regular Atari floppy. The disk-flipping thing happened because there wasn't enough room on the floppy to fit the whole file. Either that, or it was due to a lack of available memory, and in that case, my single image theory wouldn't work.

In any case, I doubt I'll ever have the time (or patience) to write a z3 game large enough to fill ONE side, let alone TWO. That way, it should still work on a single sided floppy. Still, it would be nice to know how the disk-flip thing works. The ZCut program can extract the data file from disk images of a double sided disk. I wonder if it could be reversed to write a data file back into 2 disk images. Hmm...

The plot thickens,
Steven

Like I said--find out how Tom Hunt did it, since you said in the previous post that he had put other Z3 games into Atari format. I'm sure that if you looked at the source of ZCut you'd see how the files were being extracted and could form some assumptions about how to reverse the process, but if Tom knows how to do it already, check with him.

I'm pretty sure the original Unix was for a 64K machine.

Unix doesn't have to be big. Posix, on the other hand...

Of course, Unix assumes hardware support for separate address spaces
and virtual memory. That makes it pretty tough to do on older
personal computers.

Steve, I thought you were one that "got it." Terminal programs ONLY
deal with codes 0-255. So, any terminal program on a PC that uses the
F keys as an outputed character maps them to a code in the range of
0-255 anyway. Why ANYBODY in here is discussing the hardware signal
aspects of extra keys on a PC keyboard as relates to VT100 terminal
emulation on an Atari8 is just blowing my mind.

How right you are. This is exactly what I have been saying as well.
Stop worrying about the PC keyboard's codes. Find out the VT100 codes
& what key needs to be pressed on the Atari8 under a particular
program to output the desired code to the host system.

In the Omnicom doc's, downloaded from:
http://www.umich.edu/~archive/atari/8bit/Telecomm/Terminals/omnicom.arc
I found this table:

Yale Protocol ATARI VT100 keypad Xmitted
Converter Sequence

PF1 <SELECT 1> PF1 <ESC O P>
PF2 <SELECT 2> PF2 <ESC O Q>
PF3 <SELECT 3> PF3 <ESC O R>
PF4 <SELECT 4> 7 <ESC O w>
PF5 <SELECT 5> 8 <ESC O x>
PF6 <SELECT 6> 9 <ESC O y>
PF7 <SELECT 7> 4 <ESC O t>
PF8 <SELECT 8> 5 <ESC O u>
PF9 <SELECT 9> 6 <ESC O v>
PF10 <SELECT 0> 1 <ESC O q>
PF11 <SELECT CLEAR> 2 <ESC O r>
PF12 <SELECT INSERT> 3 <ESC O s>
PA1 <SELECT Q> PF4 <ESC O S>
PA2 <SELECT W> - <ESC O m>
PA3 <SELECT E> , <ESC O l>
NA <SELECT R> 0 <ESC O p>

I'm assuming that the PF1-12 keys are what we're trying to support.

Unless you're running OmniCom, the second column is of no use to you.

But, the fourth column may be what you need. Where the host tells you to
hit the F1 key, try typing <ESC O P> (looks like caps counts).

Couldn't hurt!

-Michael

Hi,
I haven't been able to find this in this news group yet. I've got
a 600XL recently and have no real experience with it or any other 8 bit
Atari. I would like to get some sort of storage using it, and I only see
2 connectors that look possible useful, a bus connector of some sort, and
a "periphal" connector. I want to know what it'd take to any or all of
the following:

Connect a disk drive

connect a tape deck

connect a serial device

The serial port would probably be the most useful, for a modem or
nul-modem to another machine. I suspose a disk drive would take some
doing, but that'd be nice as well. Finally, I know many other machines
came with provisions for a cassette deck, which isn't my first choice but
might be easiest. Finally, I really don't want to have to dig around too
much for hard-to-find atari add-ons, so I would prefer something I could
build, something common that I could buy, or something that would only
take a special cable to hook up. I don't normally check this news group,
if anyone know's any answers could you please send me some mail? Thanks.

Dan

Well, I think the main thing is ; Do you have 64K of memory ?

> Connect a disk drive
Get a 1050 or similiar with SIO cable and power supply and your ready.
>
> connect a tape deck
Get a 1010 or similiar with SIO cable and power supply and your ready.

>
> connect a serial device
Well, there's the 850 Interface module, the Black Box and MIO, which have
printer/RS-232 + HD interface on the BB and MIO. Do the 600XL have the port
it needs to run a MIO or BB ? I am not sure, haven't tested it.

Finally, if you have a PC, get the SIO2PC cable and APE, then you keep all
disks on the PC, print thru it, and use it's modem.

Take Atarian care

Dan,
There are many add-ons available for this machine. As Vidar mentioned,
how much RAM do you have? A stock 600XL comes with only 16KB. A RAM
upgrade is definitely in order to at least 64KB. Look for any Atari
compatible floppydrive. One that I have that works well is the Atari
XF551 360K DSDD. You may not have known this, but you can connect a hard
drive (up to 8 logical 16MB drives/partitions). If you really want to
get into this, locate a Black Box and it add-ons and you will have
everything you need to all ANY peripheral. The BB supports SCSI devices,
RS232, Centronics parallel port, parallel (FAST) floppies and other
stuff.

One place to check for some of this is www.myatari.com. For the BB
contact Bob Puff at 76702.1076@Compuserve.Com or call 1-716-429-5639.

Another thing you should look into is the SIO2PC and Atari Peripheral
Emulator. Info is available at seka.nacs.net/~classics.

Hope this helps!

Hi Dan. It sounds like you are a ripe candidate for an SIO2PC cable
and the APE software (assuming you use a PC as well). SIO2PC is made
from electronic parts available on the open market, or you can buy one
assembled. Combined with the APE software running on your PC, it lets
your PC be a peripheral emulator for your Atrari. You can download
tons of great software with your PC and your Atari can use it from
your PC. Ask around here for more info.

Thanks!

I'm passing it on to NassauNet User, who started the thread. The
FlickerTerm Docs indicate that FlickerTerm also uses these codes to emulate
the Fn keys, but NassauNet User and I both prefer Ice-T.

4418. Re: Atari 600XL questions

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-07 00:00:00 UTC
From: Curt Vendel <curt.vendel.2@csfb.com>
Message-ID: <3551B56A.CE48E95C@csfb.com>
Source record: 63090

Hi Dan,

The 600XL has a Parallel Bus Connector on the rear, you can purchase a module called the Atari 1064 which is a 64K memory upgrade (suggestable if you want to use disk drives), the SIO connector will allow you to connect disk drives, tape drives, printers and serial/parallel interfaces to your computer. You may want to look into getting an Atari 1050 disk drive, they can be picked up here on the news group for about $15-$25 dollars (make sure the person you purchase it from includes power supply and SIO interface cable and a DOS diskette), as for printers, any Atari 8-bit printer will plug directly into the computer. You have a varied choice: 1020 for color plotting, 1027 for letter quality (a little slow though), 1025 for dot matrix, a recommend printer if you are going to buy an Atari one is the XMM801, it was a later model and works well, its an 80 column dot matrix printer.

Now if you want to use a non-Atari printer (like say an HP deskjet or even an HP Laserjet printer, these will also work) you'll need an interface and since you mention that you may want to do some modem access as well you'll want to look into an Atari 850 Interface module, this unit has 4 serial ports and parallel printer port (the connectors are different then the normal PC ports so you'll need the proper cables) or you can look for the lower cost ICD PR: connection interface which has 2 serial and 1 parallel port, this too will also need special cables.

Now you can place some posts here on the newsgroups and see who's selling stuff and shop around for the best price (you can probably find all of these items here and there for about $5-$25 each total, not much more) or you can call B&C Atari Sales & Service, they stock all of the above items, they may be more expensive, but your guaranteed that the equipment all works and has a warantee. Call 916-295-9270 tues-sat 10am to 6pm PST.

Good luck and take care....

For a true experience of Atari 8-bit (and C64...) technical power, get the recent European demos on a PAL computer.
On the XL/XE, the best demos are:
Overmind, Bitter Reality, More!, Drunk Chessboard... for 64Kb machines,
Igor, Ultra, Vent, Vengeance, Trip 6, Total Daze, Asskicker... for 128Kb computers.
They can be found at Sven Gleich's place.
Get them NOW!

This is a follow-up to my original post. These are the games that I've been enjoying recently...

NECROMANCER (Synapse)...After forgetting to include this great game in my first 15 picks, I noticed that a LOT of people had fond memories of this title. What do you know? It IS still an amazing game! (Really fast and complex enough that you can tackle it many ways. I love Synapse.)

HERO (Activision)...This is one of those games that as soon it ends, I have to restart and try to make it "just one level farther." Great gameplay mechanics.

BERZERK (Atari Prototype)...Why this was never officially released on cartridge, I don't know. The game is complete and a really great translation. Great speech synthesis effects, also. (Try pressing the OPTION button before you start a game to hear the different robot voices.)

KEYSTONE KAPERS (Activision)...A really simple, fun Cops 'N Robbers game. My daughter thinks it's weird. (She doesn't understand why I would want to play something like this when my Playstation and Saturn are right there next to the 800xl.)

RESCUE ON FRACTALUS (LucasFilm)...Another awesome game that I forgot to include in my first picks. Why weren't other games developed using this technology? It was clearly ahead of it's time.

BLUE MAX (Synapse)...Why does my XE cart say (C) 1983 Broderbund Software? This game always gets my heart pumping because you only have one life! Successfully making a landing right before you run out of fuel invokes a feeling few other games can match. I saw on somebody's website that they were selling the instructions for a game named Blue Max 2000? Anybody have any info on this?

LODE RUNNER (Broderbund)...These guys did great things with tiny, animated humans. (Choplifter!) Incredible level designs and innovative gameplay make this game as much fun today as it was the day it came out.

PENGO (Atari)...Really nice conversion of Sega's classic coin-op.

KARATEKA (Broderbund)...The grandfather of Prince of Persia. (Jordan Mechner designed both.) The animation astounded me at the time. Another tough game where you only had one life. I didn't complete this game for months. (I got a kick out of the movie-style intro.)

QIX (Atari)...What a strange and unique game. Totally addicting. (Even more so than my crack habit.) Another game that my daughter thinks is weird. "You're supposed to draw boxes? That's weird."

SUPER PAC-MAN (Atari Prototype)...Another great conversion that should've seen release. I was a big fan of the entire Pac-Man series. (I had the high score on

the coin-op at my local pizza shop for months until some little prick unplugged the machine out of spite! I really should have given him a beating.)

PITFALL II (Activision)...I think David Crane had programming skills bestowed upon him by the devil himself. I'll never understand how he got the 2600 version of this game to do all the things that it did, pack a huge adventure to boot, and still have the room for some great music! The 400/800 version is pretty much an exact copy of the 2600 version, which is OK by me since the 2600 version was so incredible anyway. I finished this game on the C-64 (put away your crosses and garlic) but can't seem to complete this version.

ZAXXON (Sega)...The arcade game was one of my all-time faves. Is it me or does this version seem to run at about TWICE THE SPEED! This version is VERY fast, which gives it a different twist, not unlike the 400/800 conversion of Donkey Kong.

DEMON ATTACK (Imagic)...Another game that is pretty much a clone of the 2600 version, except that the birds seem a bit more solid. (Not as much flickering.) This game becomes hypnotic after a certain point. It's a shame Imagic didn't port Dragonfire, Cosmic Ark or some of their other 2600 classics to the Atari 8-bit computers.

I really need to get access to disk based games. I've been thinking a lot lately about games like Bruce Lee, Shamus: Case II, Preppie!, Pharoah's Curse (Does anybody actually own this on cart?) Boulderdash (I would pay good money for this cart.) Montezuma's Revenge, Pogo Joe (Was this the name of that Q*Bert clone?) and many others. I really need to look into APE. Can anybody claim to own Parker Bros' Tutankham on cart for the Atari 400/800? I don't remember it being available on cart and nobody I know does either. (I really need to start limiting the length of my posts...I get so carried away!) Take care, everyone.

-Scott Wozniak

4426. What's your best rank at Star Raiders

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-07 00:00:00 UTC
From: Brant Sears <bsears@physix.com>
Message-ID: <01bd79d0$34c33a10$f0ffc2d0@bsears>

I remember reading in a long ago review of Star Raiders II that "by now everyone has achieved a rank of Star Commander and is totally bored with Star Raiders".

My best rank ever is something along the lines of "Warrior Class 5" -- SR is a fairly difficult game. I'm wondering what other people's best scores are at Star Raiders. For those of you who have become Star Commanders, what tips would you give those of us who haven't made it yet? Is there some strategy not listed in the Star Raiders manual that helps? Are there any tips you can give for saving energy?
Usually I get destroyed trying to play a Commander mission -- the Zylons destroy my shields and then hit me again before I can hyperwarp out of there. However, I am very determined to improve my rank!

Here is a link to a few C programs that can take the data files off Atari
8 bit Infocom games so they can be played on the PC interpreters. I assume
the information here could easily be used to reverse the process as
well, making new Z3 games.

Hellfire Warrior was one of the first computer RPGs I played. A friend had
it on his TRS-80 (oh YEA!) but the Atari version was better.

Anyone know where I could get an image for this? I actually have a copy
but the disk is damaged somehow. The dunjon levels are all screwy.

4430. BC's quest for tires 2

>there. However, I am very determined to improve my rank!

I'm not sure about this, but I doubt that it actually keeps track of
how much energy you use. Instead, it probably just looks at how much
you have left at the end. If that is true, then docking with a
starbase before killing the last Zylon could be well worth the time.

You can probably save energy by intentionally misjumping. Set your
destination a sector or two closer than where you really want to go
and stear off course into the real destination. With some practice,
this could save on every jump.

I also doubt that it keeps track of the types of ships that you
destroy, and I've noticed that if you warp out of a sector and return
later, they are often different types of ships. Hence, if you are
having trouble with a Zylon base star, it might make sense to warp
away and deal with it later when it's a mere TIE fighter.

Of course, time is a major factor. I think to acheive Star Commander,
you will need to reach the point where you hardly ever get hit, so you
can just go from sector to sector wiping the Zylons off the map, only
docking when your energy runs low.

Yes, both I and my friend finished it. He did legit and I cheated!
It really takes a while legit, you get less spiders in the graveyard
if you plant all the trees and (I just discovered the other day after
15 years) you can put the wisp on the trees that fall in the pits and
get them back! At any rate, the ending is just also a rainbow. But
it is pretty neat.

The other Q about Blue max 2001, its blue max in outer space and not
very good.
And the other q about why blue max cart says broderbund is because
broderbund bought synapse sometime in the 80's (and the quality
disappeared)

Steven Posey (stevenposey@usa.net) wrote:

: I don't see any computer designers today working toward that same kind
: of efficiency. Maybe that's why we all still cling to our 8-bits ;-)

Well, from the standpoint of computer and software design, one of the things that I really admire about these old machines to this very day is the creativity of the software and hardware people who developed for them.

Take software, for example. Say you're writing the next great game in the 1990s. It runs slowly on most machines and didn't run with 8 megs of RAM like you hoped. Instead of finding a spiffy algorithm which runs in a smaller memory space or runs more efficiently, you just change the "minimum requirements" to a Pentium 150 with 16 MB of RAM. With expandable and easily upgradeable systems comes code bloat.

Now, let's go back to the Atari 8-bits, the Apple][or the Commodore systems, for example.

If an Atari 800 program wouldn't run in 48K, you couldn't define a 128K requirement easily. If it ran too slowly on the 6502, you couldn't say "runs only on souped up CPUs, 10 MHz or faster, which run the 6502 instruction set." You had to really work to make it acceptable. That's where programming is an art form again instead of merely code generation which, for a sufficiently fast compatible machine with unlimited RAM, runs a program almost acceptably.

When the "limits" of the hardware were more rigid and hardly open-ended (if at all), the software was more elegant and brilliant. Also, with a fully integrated system (instead of the combination of umpteen third party components), conflicts in hardware were quite rare, and if it ran on one Atari 800, it would almost certainly run on another.

Maybe the trend to "open systems," upgradeability and mix-n-match components was inevitable...but there was an elegant simplicity to the old systems, something we'll likely never see again. That alone makes the "simple pleasure" value timeless...and I enjoy playing M.U.L.E. as much as ever anyway.

Source record: 63108

I went to my brothers PC and (much to his annoyance) replaced his CD-ROM with a 360k drive. I was downloading stuff, putting it on Atari disks with Myutil, and trying to use it on my 800xl. I have the superunarc thing but I want a thing to undo DCMs on the PC, so I can put the stuff on Atari disks. Putting DCMs on Atari disks and trying to undo them with the Atari would be dumb because I've only got one SS DD drive (some stuff wouldn't have room to expand and I would be swapping disks 50 times).

Also I've got an Indus GT drive and the FAQ says the Syncromesh mode only works with DOS-XL and SpartaDOS. It also says that those DOSs use some RAM that makes Turbo Basic not work. Any way around this? Don't have SIO2PC (yet). I wanted to run a TB video player thing with Syncromesh on so I could get higher frame rate.

> tips you can give for saving energy?

Star Raiders is a great example of superb programming all in 8K! (One
8bitter was commenting how lazy and inefficient today's software is.
instead of running on a 486DX 33 with 8 megs of RAM, the coders simply up
the min requirements infinitely and I have to agree. I have played some
arcade emulators using SparCade (coded in assembler) and the games like
Commando, Mrs pacman run perfectly, yet if I try MAME (which don't get me
wrong, is a FANTASTIC arcade game emulator, problably the best IF you
have a FAST pentium. It hardly runs at all on a 486. Why? I think it's
written mainly in C, then compiled..

Anyway, back to your real question, I could never get anything higher than
a Lieutenant (sp) rating.. Star Raiders was a GREAT little game that
demanded a lot of skill. I saw one e-mail of one user who was the REAL
star Raiders fan, and plugged his Atari 800 into some massive tower
speakers and played the game with the speakers behind him. man, that is
'experiencing' Star Raiders... not playing!

Hey! Make a QIF file for this site and put it online. I'll add it to
the
XL-Search search engine!!!

See:
http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

Note: as of this writing, the QIF file format description on the HELP
page
incorrectly states the order of the file modification date and size.
They should be date (YYMMDD) followed by size (in bytes).

All other FTP-keepers, please do this, too! XL-Search shouldn't just
be limited to UMich!!! Thanks!

both upgrades require some soldering - the AC version requires a lot of
changes compared to adding a CHROMA output. Normally, I use the
composite output as the CHROMA source.... works OK.

I can supply you with the AC edition dealing with video upgrades for $8.

Bob

Vladimir,

> Can somebody please tell me where can I get some (do places like Radio
> Shack sell them)? I did actually try Radio Shack, but I had a feeling
> that the guy didn't quite understand what I was talking about...

I have a pretty good stock of most Atari system power supplies in stock, both NEW and USED. Tell me exactly what you're looking for --- which computer system or peripheral and I'll check my stock and get back to you with pricing. Also, let me know where you're located (hopefully in the U.S.) so I can calculate the shipping cost.

Sheldon (Computer STudio - Asheville, NC - USA)

In article <Pine.LNX.3.95.980506125345.14206A-100000@animal.blarg.net>,
James Hague <jhague@dadgum.com> wrote:
>Epyx joystick, I don't think it would have been possible. I'd still like
>to know if anyone finished Necromancer. I don't think it's humanly
>possible.

I finished it once. It also had a rainbow effect at the end, which of course is nothing compared to the immense satisfaction you feel.

The trick to Necromancer seems to be knowing when to cut your losses. On the forest level, for instance, it's often better to intentionally run out of energy; otherwise the spider will destroy trees faster than you can heal them or replant. I usually come out of it with 22-25 trees.

The spider/egg levels are also a balance between smashing the eggs (which means fewer spiders in the graveyard level) and maintaining energy. I always get the ladders down as quickly as I can; that way if a spider significantly faster than my wisp hatches I can make a run for the next level.

My problem on the graveyard levels is that I get finger-tied and move my guy when I mean to move my wisp and vice-versa. I also usually get distracted by trying to hit the necromancer for energy and failing to clear my path of spiders. I can get to the fourth level pretty consistently though.

While I'm at it I might as well comment on other great games. :-)

Some people complained about Chicken. I don't see how. Are you guys trying to play it with joysticks instead of paddles? Once I plug in Chicken I play for hours. I think it's a great Kaboom variant, and it adds the strategy element of knowing when to let eggs go. It's definitely got that just-one-more-game quality. I firmly believe that if you don't like a Synapse game you just haven't played it long enough. I've never found one I didn't like, once I gave it some time to grow on me. Other Synapse favorites: Drelbs, Rainbow Walker, Slime.

Alternate Reality. Still the best game I've played. In case you all didn't know, the original authors, Phil Price and Gary Gilbertson, are working on a PC remake which is due out next year. Page at http://www.aro.com/.

Omnitrend's Universe is also a fantastic game. Between Alternate Reality and Universe I came perilously close to failing seventh grade. It would totally rock if someone would port it to the Pilot; it'd be a great time-waster when you're stuck in line or something. Omnitrend

Software still seems to be around (the logo at http://www.omnitrend.com/ is the same) but it looks like they got out of the game business. Bummer.

When I think of great software companies from the 80s I think of Synapse, Infocom, and Epyx. Many Epyx titles remain highly playable to this day, particularly from the Automated Simulations days.

The Temple of Apshai/Hellfire Warrior Dunjonquest games are superb. WHY haven't any modern RPGs picked up its fatigue system? Fatigue and encumbrance really made you feel like your stats mattered. Great manuals, too. Every few months when I forget the dungeon layout I start a new Temple of Apshai game. It's great fun to take the character you're given, no matter how crappy his stats may be, and try to get him to live long enough to explore the entire Temple and two expansion modules. (Yeah, I prefer the originals to the Trilogy. Just feels better, somehow, although the Trilogy had a catchy tune.)

Crush, Crumble, and Chomp! Another infinitely playable game that loses none of its charm with the passing of years.

Dragonriders of Pern is a fun action/strategy game with the flavor of the novels, and, for that matter, the board game the strategy section was based on. It also has one of my favorite theme songs. Unfortunately, this was released in the "flimsy boxes with HORRIBLE art" days.

Koronis Rift! I beat that one too. :-)

The early Epyx boxes also remain functional some 18 years later. Easy to use (unlike those icky two-tab Synapse boxes) and they conveniently store all the stuff associated with the game. I wish more modern software would use boxes like that.

Infocom is Infocom; you already know how great those are.

As for non-Infocom text adventures, Empire of the Over-Mind from Avalon Hill was innovative, had very descriptive writing with a real sense of place, and was tons of fun. It's a shame the author isn't given credit. I once wrote a long post on rec.games.int-fiction on what made this game so great. If you're sufficiently bored you could probably search dejanews for it. If you like text adventures, and you see this little gem for sale, buy it! It also had beautiful box art; I'd love a poster of it.

Also from Avalon Hill is Telengard, a nifty little roguelike game that kept me glued to the screen for hours.

I liked Action Quest from JV Software, the action/puzzle game in which you were a ghost that could transform into a gun. The graphics and sound were minimal and it wasn't very hard, but there's something downright charming about it. I definitely need to buy the sequel.

And who can forget The Goonies from Datasoft. Sorta like Conan with two characters. Nifty. And it had that Cyndi Lauper song in it, which unfortunately I haven't had much luck finding on CD.

There are many other excellent games, and a few in the "I like it but I'm not sure why" category, but I'll leave them for another post.

My vote for the worst game would have to go to Cavaliers from K-Tek Software. I picked it up in a lot I purchased from eBay recently. Boy howdy does it suck. It feels like a type-in game reject from the early years. I'd mention something about the lack of playability except it's so completely forgettable. The comments field in my old-software database reads "Box and docs water-damaged. Tape still loads. Astonishingly bad." For games from software houses that you've actually heard of, there's Master of the Lamps from Activision. Rather pointless and not much fun.

And, a couple of questions, for anyone still reading. Does anyone know if Mike Potter wrote K-razy Shoot-Out? It reuses some sounds and graphics from Chicken. And *what* is the Protector/Protector II theme song? Many years ago I heard someone playing it in a piano store. Random purchases of CDs of classical piano music have so far proved fruitless. Whatever happened to Moreta, the Dragonriders of Pern sequel? I've seen pictures of the box and mockups of screenshots, but nothing concrete.

Here's a question for you collectors on csa8. I'd like to know if most of the Atari computers, carts and peripherals that you own are the same exact ones that you had when you originally got into Atari computers. In other words, is the 800 that you own now the same one that you played Star Raiders on 16 years ago? This is just a question that I wondered about while looking through my 8-bit carts a few minutes ago. I traded my Atari computer setup for a Vectrex in the late 80's. It wasn't until about a year ago, while walking by an electronics store window, that I would continue my voyage into the Atari 8-bit scene. I noticed an Atari 2600 32-in-1 cart in the window of this store in downtown, New York City. I went in and asked how much he could possibly want for that "old dusty game in the window." (My words.) He told me $2.50 and I almost couldn't contain my excitement. (This was a boxed, shrink-wrapped 32-in-1 cart. I had never seen one boxed before.) I casually asked if he had any more of these. He went into the back and emerged a few minutes later with 8 more pieces! He told me I could take all of them for 2 bucks each! I got 9 new 32-in-1 carts for 18 bucks! I kept one for myself and promptly sold the other 8 for $25 each. I came back the next day and asked if he had any other "old games laying around." He gave me 6 pieces of a 2600 16-in-1 cart, and 8 pieces of a 2600 8-in-1 cart. (All at 2 bucks each, again!) I also kept one each of these and traded the rest for Super Nintendo carts. (I've only been on the net for about 3 months. Had I found these now, I would've made a KILLING on eBay!) I kept going back to this store every few days and I would get all these 2600 PAL carts for 50 cents each. I had dozens of Asteroids, Venture, Mouse Trap, and Space Invaders cartridges. (And an Asian bootleg game with the label "Missile Detense." Yes, that's not a spelling error...Missile Detense. It turned out to be Apollo's Space Chase or something like that. I traded that for a couple of Super Nintendo carts as well.) After about 2 weeks of cleaning this guy out, he claimed that he had nothing else for me. I asked him if he was sure and he came back with this big box that turned out to be an Atari XE system. I asked him how much he wanted and he told me $50. After getting all his other stuff for practically pennies, I think he started to catch on that I was making hefty profits on his stuff and he decided to get greedy. I looked at him like he was crazy. "Fifty dollars?!? For that old piece of junk? The most I'd give you was ten!" After some haggling, we settled on $20. I had never seen an XE before. I had never even heard of it. I just figured that I could probably get a decent trade for it, being that it was new and had 2 carts, a gun, joystick, keyboard, etc... I didn't even know at this point that it was compatible with the Atari 400/800 cartridges. The last Atari computer that I owned was an 800xl. After getting it home and finding out that it played the old 8-bit carts, I decided to keep it. A friend of mine told me that he knew a guy named Ben Johnson on the internet that sold carts for the Atari 8-bit computers as well as other systems like the 2600 for like 9 cents each. I ordered Pac-Man (9 cents) Star Raiders (49 cents) Centipede (49 cents) and Galaxian. ($1.09) These were the only carts he had at the time, so I took

everything. After playing Pac-Man and Star Raiders for about 10 minutes, I just knew that I wanted to start collecting for the Atari 8-bit computers again. The games brought me such warm feelings of nostalgia that it was like falling in love all over again. Holding those little metal carts in my hand made me realize that I had to get back EVERY cart that I had as a kid. (I have since accomplished this. The last cart I needed was Fort Apocalypse, which I recently aqquired, thanks to Alex Bilstein. Thanks, Alex.) I currently own about 150 Atari 8-bit computer carts, which got me to thinking about the question that I want to ask all of you. The only cartridge that I currently own, which is the same exact one that I owned many years ago is Jumpman Junior. It seems that I loaned this cart to a friend back in the early 80's, and forgot about it. A few months ago, while hanging out at this guy's house, I saw the Jumpman Junior cart laying in a milk-crate with some junk, and asked him if I could have it. I was shocked when he told me that it was mine anyway! I was so happy that I had in my posession, an actual cart that I had owned when I was a kid! Anyway...this whole big, long story just made me curious to know if you guys own all the original Atari computer stuff that you had many years ago, or are you like me...you sold it/lost it/traded it and wanted to get it all back? Please forgive me about this really long post. It seems that I can't simply ask a question without giving you the history behind my thinking. I really shouldn't write at this ungodly hour. (It's 3:30 AM...Last time I posted a message at this hour, it turned into the very long F A V O R I T E 8 B I T G A M E S. Yeah, you have me to blame for that one also.) I hope at least one person enjoyed reading this. This group has turned into my favorite newsgroup. It's one of the only few where most of the regulars are mature, intelligent people, and I actually learn things here that I didn't already know. Thanks in advance for any responses to this question. Good night and take care.

Well, lest we forget Jeff Potter's kick-ass software-based graphics
modes,
APAC and ColorView, providing 256 and 4096 colors (anywhere on the
screen)!

And has ANYONE other than me even LOOKED at the Super-IRG mode I came up
with? :)

(See my game "GemDrop" and my really-needs-work graphics editor, SIFE,
for examples... http://zippy.sonoma.edu/kendrick/nbs/atari/)

Hey! Make a QIF file for this site and put it online. I'll add it to
the
XL-Search search engine!!!

See:
http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

Note: as of this writing, the QIF file format description on the HELP
page
incorrectly states the order of the file modification date and size.
They should be date (YYMMDD) followed by size (in bytes).

All other FTP-keepers, please do this, too! XL-Search shouldn't just
be limited to UMich!!! Thanks!

I still use my 800 from the day I got it. I didn't part with it because of M.U.L.E. (four players rule) I did sell all the other stuff back in 85 when the ST came and bought that. I did buy it back though, so I still have most of my stuff I aquired. Now, I will never, ever, ever, ever sell it again. I missed it so much after I did. By 88 I got most of what I had back. My 2600 is also my first.

TJ,
There is a program called DCM2DSK at
FTP://atari.archive.umich.edu/atari/8bit . I forget the exact directory
the file is in, but it is there. This should work for you.

Jeff,
The only thing in the box on Atari supplied RF cable is a ferrite ring
and the cable is wrapped around it a couple of times. I guess it's
suppose to decrease interference. Never really made much difference
wether it was there or not, in my opinion.

Even more fun when you start designing your own levels. Back in the 80's I created about 100 levels
for mine, and I got pretty good at making them very difficult but winnable. I realized just how
good of a job I did when I went back to play some of them a few months ago. THEY KICKED MY BUTT!!!

Q: Does anybody know how to get LR to initialize a disk that's really an SIO2PC image? Every time
I try it tells me the disk is the wrong format or something. I also can't copy the disk of levels
that I wrote to a disk image. Any ideas? (Yeah, I know this should be a new thread. Sorry)

>clone?) and many others. I really need to look into APE. Can anybody claim to
>own Parker Bros' Tutankham on cart for the Atari 400/800? I don't remember it
>being available on cart and nobody I know does either.

I was reading in an old Electronic Games magazine the other week that Tutankham wasn't called
Tutankhaman because it wouldn't fit on the cartridge label and they figured that the kids playing it
wouldn't notice the difference anyway. How's that for marketing genius?!?!?!?!?

It doesn't seem to work right on ATR images, though. I tried it and it kept telling me that it
couldn't find the data file. The ZCut program at that archive did it perfectly the first time, and
I believe the source for that program is also there. I don't really know enough C to reverse the
routines; maybe someone out there would be willing to help me?

You said it, Tim!

The downside is that as long as designers and programmers are allowed to do it, "code bloat" will
continue. The Atari systems may not be contenders today, but history will show them to be some of
the most efficient machines of all time, especially if WE get a hand in writing that history ;-)

It's possible that the program won't work on ATR images but will on XFD,
which are basically just ATRs with the first 16 bytes stripped off. Try
taking off those bytes and re-running the program.

4469. Atari <-> Macintosh File transfer

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-08 00:00:00 UTC
From: Brant Sears <bsears@physix.com>
Message-ID: <01bd7aa3$81f90340$f0ffc2d0@bsears>
Source record: 63047

I want to do some file transfers between my Atari and my Power Mac. I am wondering if anyone has done this. I read tha material on the Mac/Atari fusion page. My guess is that the best method is a null modem and terminal software on each end.

I suppose I will need a Macintosh serial -> RS-232 cable, a null modem connector, an Atari 850 interface w/ cable, and terminal software on each end. Plus, a disk drive to save the files onto the Atari.

Has anyone done this? What Atari terminal software would you recommend? Telelink I? Telelink II? Something else?

Does anyone know of other options on the Atari side besides an 850 interface?

Alternatively, I could use real modems and connect the computers over the phone (I have two home phone lines already), but that would either be very slow or require an 850 interface to attach the atari to a fast(er) modem than 300 baud. Any thoughts?

Message-ID: <6ivlh3$3br@ss.netgate.net>
Source record: 63052

Curt Vendel (curt.vendel.2@csfb.com) wrote:

: The 600XL has a Parallel Bus Connector on the rear, you can
: purchase a module called the Atari 1064 which is a 64K memory upgrade

Wait. I always thought the 1064 was vapor except for a few prototypes (like the 1400/1450XL, 1090 et al). How easy is it to "purchase" a 1064, and how much do they cost when you can find them? I'd imagine they have more "collectors item" value to Atariphiles than they value in enhancing the system.

: (suggestable if you want to use disk drives), the SIO connector will
: allow you to connect disk drives, tape drives, printers and
: serial/parallel interfaces to your computer. You may want to look
: into getting an Atari 1050 disk drive, they can be picked up here on the
: news group for about $15-$25 dollars (make sure the person you purchase
: it from includes power supply and SIO interface cable and a DOS
: diskette), as for printers, any Atari 8-bit printer will plug directly
: into the computer. You have a varied choice: 1020 for color plotting,
: 1027 for letter quality (a little slow though), 1025 for dot matrix, a
: recommend printer if you are going to buy an Atari one is the XMM801, it
: was a later model and works well, its an 80 column dot matrix printer.

I don't know who has them any more, but if you can find cheap drive mechanisms, that is a good investment protector. I bought four complete drive mechanisms for $50 back when American Technavision was blowing them out. I had to use one already.

My 1025 works well, but is that sucker ever loud.

: Now you can place some posts here on the newsgroups and see who's
: selling stuff and shop around for the best price (you can probably find
: all of these items here and there for about $5-$25 each total, not much
: more) or you can call B&C Atari Sales & Service, they stock all of the
: above items, they may be more expensive, but your guaranteed that the
: equipment all works and has a warantee. Call 916-295-9270 tues-sat
: 10am to 6pm PST.

It may also be possible, if you have nothing at all, to buy a complete system with peripherals and software. That may be the best way for someone to go if they have nothing. I've seen 800/800XL systems with two 1050s, a printer, an 850 interface, joysticks and software selling for under $100.

B&C is a good fallback position, and they provide a very useful service when we "have to have" something, but they typically charge perhaps 2-3 times what you can find on the net with patience. (They are,

after all, a business which needs to make a profit to stay afloat.)

I don't think the 916 area code works anymore; they had a split
last year. I think the new area code is 530, but I'm not positive.

I do miss being able to wander into their Santa Clara store, though.

Yes, I've earned "Star Commander Class 1" any number of times.

tips-

Play Commander level (anybody gotten Star Commander Class 1 on warrior
level? I don't think I ever have.)

Keep shields off unless you're about to be hit. Energy consumed is a BIG
factor.

Keep your Computer and Tracking off as much as possible as well, for the
same reason.

Fight with your engines off, to conserve energy. If they don't come to
you, chase them as efficiently as possible, and turn your engines back off
once you've got their attention.

Defend those starbases! If you let the Zylons destroy one of your
starbases, you have no hope of the top ranking.

Keep moving! Time counts as well. (and you have to act fast to keep your
starbases safe in Commander level.)

Learning how important it is to conserve energy was the biggest key for me
to get the top ranking the first time.

Source record: 63054

Hi all Atarians,

I have just updated my Atari XL/XE webpage:
http://www.xs4all.nl/~stack/atarixle.html

I've placed a new version of XDIR on it.
The current version is now 7.00.00
A few minor bugs have been removed (medium and double sided XFD's
weren't correctly recognized, but no user reported this to me ;)).
The current version supports a mouse as well now.
And more important, it supports double sided disks now.
Let me know what you think of this little utility.

Thank you,
Bo.

Well, let's see. There's the P: R: connection, which should be able to do
9600 baud over a null-modem cable, or the MIO or Black Box, which should
give you 19.2 KBaud.

> Alternatively, I could use real modems and connect the computers over the

That's a lot of trouble, and you'd be paying for a call every time you do
it. But if nothing else works, have fun!

You could also upload the files to a friendly BBS and then download them
with the other machine.

Well.... believe it or not, but its actually a local call to call my house
/from/ my house, so I don't actually get charged extra for that.

What is this P: R: connection?

Brant Sears

4481. Double density

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-08 00:00:00 UTC
From: stack@xs4all.nl
Message-ID: <35537fe1.31992705@news.xs4all.nl>
Source record: 63059

Hi ALL,

I just posted that XDIR supported double sided disks,
but of course I meant double density disks instead...

Sorry 'bout that.
Bo.

4482. Auction: Atari 8-Bit Computer Magazines, Manuals, Disks, More!

Newsgroup: comp.sys.atari.8bit

May Auction - Update 3

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Wednesday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

> Does anyone know of other options on the Atari side besides an 850
> interface?

I use BobTerm with my IBM clone. ProComm (not Plus, the old shareware
version) on the IBM and use Ymodem (batch) for the transfers (put the IBM
in host/BBS mode and just call in with the Atari and download the files
via null modem). I use a P:R: connection. If you have terminal software
for the powermac that has a host or BBS mode, that may make it easier.

> Alternatively, I could use real modems and connect the computers over the
> phone (I have two home phone lines already), but that would either be very
> slow or require an 850 interface to attach the atari to a fast(er) modem
> than 300 baud. Any thoughts?

Heh heh... for my brother in law's old Apple IIe (300 bps modem installed)
I did this, but not over the phone lines! Just conencted the modems
together with phone wire cord. Only problem is being sure to use the AT
commands to force the connection in the absence of a dial tone.

In comp.sys.atari.8bit Brant Sears <bsears@physix.com> wrote:

> What is this P: R: connection?

ICD's serial (SIO port) interface providing a P:(printer) port and several R:(RS232 compatible) serial ports (like the Atari 850).

It is better than the 850 for graphics printing programmes (I believe that if the 850 sees two EOL codes (CHR$(155)) in succession, it changes to two CR codes (CHR$(13)) with a space between them! That space can screw up the byte cound in sending graphics data. The P:R: just converts to CHR$(13) (different bit pattern, but no miscount) (unless it is configured to add LFs, CHR$(10)). The original PrintShop only used 7 bit graphics (so no chr$(155)s ever sent!). Others, like DDIII, did not permit 155 bit patterns (or 13 or 10 either). The difference between Atari EOL (CHR$(155)) and IBM EOLs (CR+LF, CHR$(13)+CHR$(10)) (and Macintosh [E]nd [O]f [L]ine codes, CR=CHR$(13)) (and even Unix EOLs, LF=CHR$(10)) sometimes led to problems depending upon how a hardware printer port for the Atari handled the conversions).

4485. Game of the Week

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-08 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6j0683$l75$1@dartvax.dartmouth.edu>
Source record: 63063

Here's an idea that I would like to implement, but don't have time to do myself. It is presented in the hopes that someone else might want to take it on:

Every week announce on comp.sys.atari.8bit a new "Game of the Week," and create an associated web page for the game (possibly with a copy of the game). During the week, people here would play the game, discuss it, and perhaps compete for a high score. A summary of the more interesting discussion might be added to the web page which would be archived in the growing collection of games from previous weeks.

I'm thinking that the best candidates would be games that someone might mention in a list of their favorite games, but not ones that everyone has played; games worth playing that probably have aspects to them that most people haven't experienced yet. I'm also thinking that arcade-type games may be better candidates, as a week is too short of a time frame for many of us when it comes to adventure games and such.

Anyone want to take the idea and run with it?

Wow...Gardner Computing...
They came out with a disk called "the Hacker's/Pirate's Treasure Chest".
It had a number of programs on it like a hex editor for disk, copy
programs for just about anything, and a neet program called "CARTDUMP"
that copied cartridges onto a disk. That last program did and did not
work, depending on the cartridge. That was one hell of a collection of
programs, and if Gardner computing is reading this...THANK YOU!!!
Anyway, If he gets that article posted, let me say that Gardner probably
knows what he's talkin' bout!

I have the following Atari 8 bit hardware that needs a good home. Buyer will add shipping:

1. Atari 400: With power supply and built in RF cable. System works fine and is in great shape cosmetically. I will add a Basic cart with the computer.....$20

2. Atari 800: With power supply and built in RF cable. System works fine but keyboard is missing a few keys, but the keys still work. Computer has 48k RAM.....$20

3. Atari 600XL: Bare console. Boots up to basic, but keyboard will not respond.....
.....$5

4. Atari 800XL: Bare console. Boots up to basic, but screen is distorted as is sound.....$5

5. Atari 800XL: With power supply and RF cable. System works fine and is in excellent cosmetic shape.....$35

Please send replies to wesinnc@aol.com

Thanks,
Wes

ATARI 8-bit super deal!!! System and Tons of Software!

Atari 800 Computer - great working condition

Atari 1050 disk drive- Stock drive in great working condition

Atari 410 tape drive - great working condition

APE SIO2PC cable built into the 800 - Let's you plug the 800 drive directly into your PC serial port and play *.atr and *.exe images from your pc hard drive. APE software must be downloaded from the APE site (click here). Read all the details there as well! *SEE INFO ON CD*

4035+ more program files on CD (2550 games for the atari 8-bit) - tons of disk images, contains 2550+ games for the 800, complete Atari Antic magizine software archive, Complete Atari analog magizine software archive, 500+ for the Atari 2600 (with emulator), 50 games for the Atari 5200 (with emulator), and a ton of Atari ST games and programs(with emulator) ALL the ATARI 8-BIT software on cd will work with the APE cord if designed to run on a 800/400(some titles will only run on the xe/xl series)

also add shipping cost, comes with some carts Pac-man, Qix, Star raiders
NO CHECKS

My all time FAVORITE 8bit games

1 Beamrider
2 Hero
3 Koronis Rift
4 Spindizzy
5 Arkanoid
6 Star Raiders
7 Zorro
8 Goonies
9 Defender
10 Drop Zone

Beamrider by activision got me hooked I just had to get to the next level -
level 45!!!

Same here. I still have most of my original stuff. I lost some of it in
the late '80s when I lent some of my favorite games to a kid of a friend
of mine. A few years later, I asked for it back (the kid was in the
Marines by then) and what I got back was not what I had lent him. Most of
it I've replaced now, except for a boxed Ultima III (with the cloth map!)
:-(. I'm glad I kept all this stuff. Of all the stuff I kept, one of the
coolest things is valFORTH. I bought their whole development system way
back. Mountains of documentation (all printed in light blue on yellow to
prevent photocopying); scads of floppy disks! I never did anything
significant with it, but it sure was fun to play with. Anybody ever use
this development system and actually do something with it? Wonder what
ever happened to those valFORTH guys?

There is a way to do it, but you had better be handy with a soldering iron, as it is not a simple circuit. <grin>

If you are interested, I believe I still have the GIF files I made from the scan of the pages of the article.

There is also a quick and nasty method, using the method mentioned in the Atari Classics special video issue intended for use with digital RGB monitors, and knocking down the TTL levels signals with resistors. The drawbacks are that the colors are not only inaccurate, but also the total palette is limited to 8 colors.

BS>I just got an Atari 130 XE that is missing the TV switchbox and the cabl
BS>that goes between the computer and switchbox. Does anyone know if it is
BS>possible to just buy a plug at Radio shake and run wires to the TV sans
BS>switchbox? I'm using a dedicated TV.
Nope, there's something special in the cable, some kind of magic box at a
mid-point in the cable. I've never bothered to look and see what is in it.
Anyhow the switchbox is pretty generic though. You should be able to find
those in just about any electronics component store.

If this is still available, and the computer is in good working order,
I would pay $40 for the Mega STe/2 (and keyboard) alone.

If you really would not want to bother with selling off the other
parts separately, I would have to see what I could come up with (money
is getting a bit tight at the moment).

If you have already sold this, please let me know.

All,
Just a little side note. The ESC O (x) codes are used for many comm
programs. The Lucent Technologies Terranove software uses this set to
send commands to their PBXes. These seem to be fairly standard codes.

The utilities to read SS/DD 180K Atari-format disks on a PC, such as
MYUTIL, should work fine with SS/DD 180K DOS XL disks.

I finished Necromancer.. on the emulator, and on the XE game cartridge.
The last level is fast and furious but it wasn't that hard. I think a
good way to win is to get A LOt of trees planted in the 1st round.

The ending is colourful but not too flashy.. Necromancer wasn't THAT HARD
of a game to win...

Yeah.. for a basic game it was really a good one.. and God knows I typed
in enough basic games in my younger Atari years...

I went through a lot of Atari 8bit's in my day.. (sheesh, it sounds like I
am war veteran or something.. heh. in My day...)

Anyway, 1st 8bit, Atari 400 16k with Dig Dug bought in 1984.
a few years later I got a 64k 800Xl and a 410 tape drive.. (moving up in
the world ya know)

Between 1989-1994, I went through buying/selling a 130Xe, a 65Xe, my
original Atari 400 (I should have kept it! That is what we all say!),
about 5 Atari 800Xl (I still have the 256k 800Xl, sitting on my desk) and
an Atari 600Xl. And I went through about 6 1050 drives, 1 Xf551 bought in
1989 (still have it!), and an Atari 810 drive that could read but wouldnt
write..

> each. I ordered Pac-Man (9 cents) Star Raiders (49 cents) Centipede (49 cents)

Thanks for these posts, Scott. The nostalgic (sp?) feelings really come
back. I used to dream about buying Atari 8bit ROMs for like 25 cents
each.. I used to get so happy, then wake up and realize it was only a
dream and get all pissed off. Heheh... I had an Atari childhood.. no
doubt about it...

Alan
(who regrets the day he sold his Black Box and Hard disk setup...)

I was always a Garbage Scow Captain if I tried the hardest level (which
you have to do if you want a rating higher than Lieutenant..)

Was Star Raiders ever ported to other platforms (besides the Atari 2600
and Atari 8bit computer line?)

$7.00

ATTANK. by Joel Glick. Atari Program Exchange. Floppy plus manual. No box.
VG++
$4.00

BILL BUDGE PINBALL CONSTRUCTION SET from EA. 1982. 5.25" floppy, manual.
VG/VG++
$7.00

BEACH-HEAD by Access. 1983. 5.25" diskette plus instruction card. No box.
NM
$3.00

CROSSFIRE Floppy Disk in official dust jacket plus manual from ONLINE SYSTEMS (later became Sierra OnLine). No box.
VG++
$5.00

DRAGONRIDERS OF PERIN from Epyx. 1983. 5.25" floppy plus manual. No box.
VG++
$3.00

DUNJONQUEST: TEMPLE OF ASPHAI. 1981 Automated Simulations. 5.25" floppy plus manual command card, and loading instructions.
VG/POOR
$5.00

DUNJONQUEST: UPPER REACHES OF ASPHAI. Expansion kit #1 for Temple of Asphai. 1981 Automated Simulations. 5.25" floppy plus manual and loading instructions. Also includes photocopy of Temple of Asphai manual and help guide. No box.
NM
$4.00

THE E FACTOR Floppy and manual and box from Cosmi
$3.00

the EIDOLON from EPYX and LUCASFILM. 1985. 5.25" floppy, manual. Some writing with a pen on back of manual. Requires 64k. Flip side of disk for Commodore 64.
GOOD/VG
$7.00

F-15 STRIKE EAGLE from MicroProse. 5.25" floppy (C64 version on flip side), manual, box.
G/VG++
$7.00

F-15 STRIKE EAGLE from MicroProse. 5.25" floppy (C64 version on flip side), manual, no box.
VG++

$5.00

FAMILY FINANCES 1 & 2. Official Atari release on 2 floppys. User's Guide included. No box.
VG+
$2.00

FIGHT NIGHT from Accolade. Complete.
VG++/VG++
$5.00

FLIGHT SIMULATOR II from SubLogic. 48k memory. Two 5.25" floppys, Flight Physics manual, Pilots Operating Handbook manual, reference card, 2 maps, release notes.
VG/VG++
$7.00

FONTEDIT; IRIDIS 2 from The Code Works. Cassette tape,56 page manual.
SS(shrinkwrapped)
$5.00

GALLAHAD AND THE HOLY GRAIL. by Douglas Crockford. Atari Program Exchange. Floppy plus manual. No box.
Good.
$4.00

GAUNTLET from Mindscape. 1985 for 800, XL,XE 64k. 5.25" floppy. No manual. Colorful cartoon-lke folder/box.
VG+/VG++
$5.00

GREAT AMERICAN CROSS-COUNTRY ROAD RACE from Activision. 1985. Instruction card plus diskette. Works with 800/xl/xe systems.
VG++/VG++
$4.00

LEADER BOARD DUAL PACK. from access. 1987. Double sided floppy, manual. No box.
VG++
$5.00

MICKEY IN THE GREAT OUTDOORS. From Walt Disney Personal Computer Software. in Dust Jacket, plus manual and box. The box is about 8x10", plastic, with Mickey on both sides (and as with many games from this period, is the best part of the package)
NM/NM
$7.00

PAINT from Atari.
NEW(shrinked)
$15.00

PREPPIE II. Floppy plus very colorful manual, plus very colorful plastic box.

VG++/VG++
$7.00

REALM OF IMPOSSIBILITY by Mike Edwards from Electronic
Arts.......Floppy plus box (10" flat square box) from Electronic Arts.
VG++/VG++
$7.00

ROMMEL; BATTLES FOR TOBRUK from GDW and EA. 1986. for 48k or XL, XE.
5.25" floppy, rules manual, historical manual, loading card, reference
card, warranty card, quick reference card, 5 maps.
VG++/VG++
$10.00

SILENT SERVICE. Microprose. 1985. Strategy (submarine). 5.25" floppy
(commodore one side; Atari the other side), manual.
VG++/VG++.
$7.00

SILENT SERVICE. Microprose. 1985. Strategy (submarine). 5.25" floppy,
manual. No box.
VG++.
$5.00

$7.00

==========

Here is the way I grade software. There are seperate grades for the box first, and what's in the box second. For example, VG++/NM would mean the box is VG++ and the contents of the box is near mint.

Shrinkwrapped (ss)
Self-explanatory.

Near Mint (NM)
This is the highest grade for an unsealed item. "Mint" is not used as a grade because, without a microscope and 40 minutes of inspection, perfection cannot be verified to everyone's satisfaction. Near Mint ranges from appearing unused, to an item that may have been used, but is without a notable cosmetic defect as evidence of that use.

Basically, a NM/NM package should be a reasonable simile to a fresh, unused copy.

Very Good Plus Plus (VG++)
This grade refers to an attractive, fresh-in-appearance item that, upon closer inspection, has been disqualified from the NM category due to (usually) one flaw that could not be overlooked.

For boxes, this includes: a small split of the seam; some clear tape on one corner.
Basically, and this includes the contents of the box as well, a VG++ item is qualified by having a noticeable, yet functionally insignificant defect that verifies that the item has been used. A VG++ item appears neither blatantly second-hand, nor does it have the sparkle of "brand-new".

Very Good Plus (VG+)
This is the broadest grade serving as a catch-all for
any decent, presentable,
average, usable (not marred or defective) item.
People ordering VG+ items
usually are prepared to accept an imperfect item
representing the artifact
that it is, and are going to enjoy it without being
excessively preoccupied
with cosmetic details. VG+ is a fine copy that is
indisputably "used", being
your basic "decent used package" for utilitarian
purposes.

Boxes and contents will have some combination of one
to a few of the following
defects:
partial seam split (with or without clear tape
repairs), minor dirt ring,
some minor warping due to moisture, a creased
corner, small squishing of the
box.
The box and contents must be free of major
defacements, and will certainly not have ALL of the
preceding minor ones on the same piece!

Very Good (VG)
This is the beginning of "rough" for collector's
purposes. A VG record is
usually one that a collector will buy to fill a
"hole" in his/her library until a better copy
comes along. We usually don't advertise items with either VG
covers or discs unless they are deemed scarce enough
to attract a collector
for this purpose.

Good Plus (G+)
Averaged between VG and G,

Good (G)
Items graded "good" are very used and only
presentable to the least
discriminating collector. This classification is
usually employed for
boxes when it's the contents that's worth collecting,
and vice-versa; or when
the component in question is so very rare that its
existence in any condition
is regarded as manna from heaven. It should not be
confused as referring to "Good" COLLECTIBLE

Fair (Fr) or Poor (P) or Missing Component ()
For advertising purposes, if either box or contents

is either Fair or Poor, we
treat it as functionally missing , and we have graded
only the component
that is G or better, essentially selling that
component "as is", theoretically
without its decrepit companion. In these cases, the
grade should include an
asterisk in place of the Fair/Poor cover or jacket to
reflect its effective
absence.

Supplementary Notations
Condition augmentations: there are some common
exceptions to the overall
condition of an item that merit independent notation
from the
overall grade assigned, rather than being "averaged
in" as with standard
gradeable wear. These are usually after-production
aberrations courtesy of
the record company such as:

Writing on front cover, back cover, label, tape
on seams or spine,
water damage (especially if it's growing "hair"),
applied era "pop-culture"
stickers (such as "right-on" with fist) etc.
These minute details are usually only noted on
rare and expensive items.

ATARI ST STUFF:

Hardware:
==========
ATARI 1040ST COMPUTER
ATARI PS3000 Monitor/Floppy drive.
ATARI SF354 floppy drive. 3.5". Drive only.
ATARI SC1224 monitor. Excellent.

Complete Software Packages
Assume there is a box unless it says otherwise.
==========

BALANCE OF POWER THE 1990 EDITION by Chris Crawford from Mindscape.
3.5" floppy requires Dual-sided drive. Manual, warranty card,
reference card. Box has two small puncture wounds on rear side,
otherwise perfect.
VG+/NM
$10.00

BATTLEHAWKS 1942 from LucasFilm. Two 3.5" floppys, manual (which is a
spiral bound book).. Box is shrinkwrapped except top where opende. 1"
tear in flap).
VG++/VG++
$20.00

CAPTAIN FIZZ MEETS THE BLASTER-TRONS. from Psygnosis. 1988. 3.5"
floppy, manual. Platform game. Box crushed a bit only on underside.
VG+/NM
$10.00

CHAMPIONSHIP WRESTLING from Epyx. 3.5" floppy, manual, box. Box has
been crushed
VG+/VG+
$7.50

ELITE from Rainbird. 3.5" floppy for color machines only. Manual,
loading card, warranty card.
VG++/NM
$10.00

FALCON THE F-16 FIGHTER SIM from Spectrum Holobyte. 1987. Two 3.5" floppys, manual, map, warranty cards, lots of inserts. Box is shrinkwrapped except at top, where opened.
VG++/NM
$20.00

HOYLE BOOK OF GAMES VOLUME 2 SOLITARE from Sierra. 3.5" floppy, manual, warranty card.
VG++/NM
$10.00

LEISURE SUIT LARRY IN THE LAND OF THE LOUNGE LIZARDS from Sierra. Two 3.5" floppys, manual, reference card, aratist reference card, read-me-first sheet.
VG++/VG++
$15.00

MARBLE MADNESS from EA. 2 floppys, no manual, in a folder/box.
VG++
$5.00

PALADIN from Omnitrend. includes the Quest disk. 3.5" floppys. Complete.
VG/NM
$12.00

POPULOUS by Bullfrog from Electronic Arts. There are 2 differend 3.5" floppys in this package. One has a yellow label #e09731XL and the other is black #352702. The spring for the sliding door is missing on the Yellow label so the black on may haver been a replacement. Manual, warranty card, loading instructions.
NM/NM
$15.00

ROCKET RANGER. For the Atari ST. Cimemaware. Interactive Movie. Complete with all props, and three 3.5" floppys.
VG++/NM.
$25.00

SHADOW OF THE BEAST from Psygnosis. Two 3.5" floppys, manual.
VG++/NM
$10.00

SPACE CUTTER from Rainbird. 3.5" floppy, manual, warranty card. This looks new but there is a 1" scrape on top flap of box.
VG++/NM
$10.00

STAC THE ATARI ST ADVENTURE CREATOR. from Terrific Software. 1988. Two 3.5" floppys, manual.
NM/NM
$10.00

STARQUAKE from Terrific Software. 3.5" floppy, manual, warranty card, aftermarket paper map. Box is still shrinkwrapped except top where opened.
VG++/VG++
$10.00

TALESPIN. AN ADVENTURE GAME CREATION PROGRAM from Microdeal. 1989. Two 3.5" floppys, manual, warranty card, lots of inserts. Box has one 3" wrincle.
VG++/NM
$10.00

TETRIS from Spectrum Holobyte. 1987. Two 3.5" floppys, manual, warranty card.
VG+/NM
$10.00

THEIR FINEST HOUR from LucasFilm Games. Two 3.5" floppys, manual (a spiral bound book), code wheel, warranty card, inserts, reference card.
VG++/NM
$15

TOWER TOPPLER from Epyx. 3.5" floppy for color machines only. Platform game. Manual, loading card, catalog, lots of inserts. Box is shrinkwrapped except at top.
VG++/NM
$7.50

TRAILBLAZER from Mindscape. Floppy, manual, in a folder/box.
VG++/VG++
$7.50

TV SPORTS FOOTBALL from Cimemaware. 3.5" floppy, manual, player guide, warranty card, catalog, lots of inserts.
VG+/NM
$15.00

WORLD KARATE CHAMPIONSHIP from Epyx. Two 3.5" floppys, manual, box. Box has been crushed. Manual has rusty staples.
VG+/VG+
$7.50

ZAK McKRACKEN AND THE ALIEN MINDBENDERS. from Lucas Arts. 1988. Graphic adventure. Three 3.5" floppys, manual, security card, National Inquisitor newspaper, box.
VG++/VG++.
$15.00

ZAK McKRACKEN AND THE ALIEN MINDBENDERS. Hint Book. Lucas Arts. still usable but missing the red plastic strip fro viewing the book.
VG++
$5.00

ZANY GOLF from Electronic Arts. Two 3.5" floppys, box. No manual.
VG+/NM
$5.00

Floppy disk only
==========

TV TITLES 2.0 from J.P. Deziel Serial # 120.
VG++
$5.00

4516. Mux FS

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-09 00:00:00 UTC
From: af332@freenet.hamilton.on.ca
Message-ID: <6j2ppd$cc7$1@mohawk.hwcn.org>
Source record: 62896

I have a MUX from CSS. It has a Master and 3 Slaves.

The Mux is a neat but finicky (in my opinion) piece of hardware/software. For those who do not know, it allows you to connect up multiple Atari machines to use one "Master" which usually is connected to a hard disk system. It requires an OS chip swap for the "slave" computer to use the Mux cart. I am selling this item AS IS. In other words, if you get a lot of errors on the bus, (RF interference whatever), it is your problem to get it going. No refunds. The MUX worked that last time I had it going.

I am asking $100 US shipped to your address in Canada or the USA, and $100 plus shipping costs elsewhere.

Willy

4518. Atari 8-Bit to Amiga file transfer?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-09 00:00:00 UTC
From: XDelusion@wcoil.com
Message-ID: <6j0ltt$1bn$0@208.10.3.74>
Source record: 63069

HOw do I hook up an Atari 8-Bit to its big brother the Amiga? I'd really like to transfer files
between two systems!

Thankx!!

XDelusion

By the way, a while ago the Author of APE said he would be interested in doing an AMiga version of APE
so if any of you are hip to this concept then PLEASE get in touch with him!!

4519. Specs for DOS XL

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-09 00:00:00 UTC
From: AKatz712@juno.com
Message-ID: <6j0n0m$850@bgtnsc03.worldnet.att.net>
Source record: 63070

I am interested to see if anyone knows the technical specifications on how DOS XL by Optimized Systems Software formatted the double density (180K) floppy disks. That was my DOS of choice. (DOS XL version 2.3)

I have old disks and I want to read them onto my PC and use the Atari Emulators to run the stuff on them. I no longer have a working 8 bit machine.

I have seen a MYDOS 4.5 MSDOS reader and manual and I would like to know if I need to modify that software to work with disks created by DOS XL.

Thanks.

Source record: 63071

I would like to buy a copy of the schematic for the 1200XL, hopefully one
of those big 1-sheet types, but I will take sectioned photocopies.

I tried B&C, but they dont appear to have them anymore. Also, does
anyone have a copy of the XEGS schematic that would sell for
less than the B&C price (25.00)?

It is not there to just fool you. The loops around the ferrite rings
serves to help reduce interference. That does not mean that it is
needed because in general it isn't I remember early Zoom 28.8 modems
had a hinged ferrite module to coil your phone line through. Later
they stopped including these. Milage varies I guess.

In VT-100 emulation, the F keys and arrow keys should generate an escape
sequence (a series of characters beginning with chr$(27)).

I thing that's a great idea! My experience is that once you read
about something (in this case: a game), you get excited about it and
want to play it. That's more or less why I still enjoy the 8-bit Atari's:
because I read about them on this NG every day!

So who has some bandwidth to spare and who wants to supervise it?

Take M.U.L.E. for example, which is supposed to be a great game,
but I have never really played it, because I'm not really sure what
to do, or even if I have a correct version. If I could somehow be
"turned on" to it, I'm sure that would give me a lot of playing fun!

Not much space it needed, I would think: Just the game, a discussion
board (this NG?), the manual, some screenshots, and maybe a scan of
the packaging/ label? The more I think about it, the more I like it!

> Does anyone know of a good DOS that will support the XF551
> 3.5" upgrade?
> I plan to replace the 5.25" mech. in one of my drives to the 3.5"
> mech.
> from my SF314.

After swapping the mech, you will also need to swap out the ROM with one modified to accomodate 80 tracks. After that, SpartaDOS will support it directly. MyDOS will do it to, but I think you have to tell it high-density drive, 2880 sectors.

4526. XF551 3.5" upgrade text

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-09 00:00:00 UTC
From: lenspencer@aol.com
Message-ID: <1998050913034000.JAA18513@ladder01.news.aol.com>
Source record: 63077

Here is the text of the article by Bob Woolley on upgrading the XF551 to a 3.5" drive. This text is also available at ftp://members.aol.com/lenspencer/fxep/xf551.txt.

NOTICE: This article originally appeared in the January, 1989 issue of Atari Interface Magazine and may be freely distributed or reprinted in non-profit User Group publications as long as the article's author and Atari Interface Magazine are credited AND this notice is reprinted with the article. All other publications must obtain written permission from Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, Phone: (313) 973-8825 before using this article.

Inside the XF551 Disk Driveï¿½by Bob Woolley (SLCC)

[Editorial notes by Len spencer]

It has been almost a year since I first got my hands on an XF551. Busy little hands... Of course, the first thing I did was to tear the thing apart to see how it was put together. And, maybe do a little "put"ing myself. As a result, I have made a few modifications that may be of interest to other XF551 owners. You will not be able to successfully make these changes unless you have reasonably decent electronic skills, so don't gamble with your new XF551 unless you know what you are doing. Most User Groups have skilled members that will be happy to guide you if you need help.

First

But, before I get caught up in details of the drive, I would like to clarify some points on the XF551. The drive IS double sided and can read and write in single, enhanced or double density. The "book" that comes with the drive is incorrect. MyDOS, SuperDOS and SpartaDOS can all format the drive as double sided and double density. Previous Atari drives did not use the INDEX hole on the diskette, which allowed us to flip the disk over and format the back of the media. The XF551 uses a standard, bone stock, IBM-style drive. It uses INDEX. It will not FORMAT the back of a diskette unless the disk jacket has two index holes. It WILL read and write to the back of any disk. Guaranteed! On side one, the tracks on the disk are written from the outer edge in, from 0 to 39. On side two, the tracks are written from the inner edge out. This allows us to read the first 40 tracks of a DSDD diskette on a SSDD drive. The second side is not backwards nor could it be read on a SS drive even if you changed it. The speed of the drive is NOT 288 RPM, the speed you are used to seeing, but 300 RPM, the industry standard. The XF551 compensates for the difference by using a clock frequency 4% (.33mhz) higher than it should be. This will read and write the data in exactly

the same place on the diskette as your 288 RPM drive, although programs that measure the speed of the drive will read 300 RPM.

Talking To The Drive

The XF551, as it comes from Atari, has the ability to format a diskette in any of three configurations: single density (SSSD-88K), 1050 density (SSED-127K) and double-sided, double density (DSDD-360K). The DSDD format has a standard skew (skew is the physical sequence of the sectors on the disk) and a high speed skew option available to the user. This extra skew layout allows faster data transfers on the SIO buss, much like the ICD Doubler upgrade on the 1050. For those of you interested in programming, the DSDD format SIO command is $23. For a high speed skew format in DSDD, you just need to turn on bit 7 for a value of $A3 (the SSSD and SSED formats do not have a high speed skew, although the drive will transfer data at high speed in those densities). To transmit data at high speed to and from the XF551, just set bit 7 of the command to "1" again (a get sector ($52) with bit 7 on is $D2). You must still send the command frame at the normal SIO rate ($28 in $D204) and then set $D204 to $10 for high speed operation during the data frame. The drive will also recognize the Put (and Get) Option Table command ($4F and $4E), which are similar to the Percom configuration table operations. Only bytes 4-8 are changed by the Put command, however, and only the three supported formats will be recognized. Even if you sent the Option Table a 512 byte sector size, you would only get 256 byte sectors. A number of the newest DOS versions (SpartaDOSX, SuperDOS 5.0, DOSXE...)now have XF551 support built in. Also, a file is available in Atari8 on CompuServe that will modify SpartaDOS 3.2D for the XF551 features (in DL3 - XF32D.BAS). Using any of these methods will transfer data almost twice as fast as DOS 2.0.

Into The Hardware.

The first thing you notice about the ICs in the drive is the one in a nice socket, the ROM. Makes it a lot easier to burn an EPROM (use a 2764) to make code change if you can just plug and unplug your devices. I didn't see the ROM source code printed anywhere, so I wrote a simple disassembler for the 8050 MPU used as the brains of the drive. [Some were manufactured with an 8040. It has the same 256 bytes working RAM as the 8050, but no built-in ROM. Apparently the internal ROM was never used, as the drive OS is on its own ROM elsewhere on the board. - L.S.] It was very nice when Atari used a 6507 (which uses 6502 OPCodes) in their drives but, no more. Everything Atari comes out with now seems to use a different chip and this 8050 stuff was a bear. Finally, I got most of the program logic worked out and designed some changes:

One upgrade that was available for the 1050 is a ROM change that will re-address the drive as D5: through D8:. This can be done on the XF551 ROM by altering location $0095 from $31 to $35 ($33 gives you a range of D3: to D6:, etc.). Having 360K is nice. Having 720K is even nicer. Putting a 720K, 3.5 inch drive in place of the stock drive is not too hard, so let's start with the ROM. There is a little bug in the code that allows the drive to start writing the track before it has reached

operating speed. To remedy that, change $528 from $90 to $00, $C1D from $88 to $80 and $E25 from $88 to $80. [I have heard reports that this may be unnecessary, so you may or may not want to make the aforementined changes. I have had the problem, so better safe than sorry. - L.S.] The 720K drive has 80 tracks per side which requires you to change $680 from $28 to $50, $80F from $30 to $60 and $811 from $FD to $FA. A 3.5 inch drive uses a 3ms seek time -- change $53D from $00 to $03, $57B from $18 to $13, $9D1 from $08 to $03, and $B15 from $18 to $13. Finally, the 3.5s use write pre-compensation -- change $61D from $F6 to $F4, $621 from $F6 to $F4 and $D0D from $A2 to $A0. For a drive, I used a unit from JDR Microdevices (MF353B Mitsubishi) that plugs right into the 5.25 connectors and uses the same mountings as the larger drive. This simplifies the installation quite a bit. When you go to plug in the 3.5, you may notice that the 34 pin cable is too short. I de-soldered the connector and added a longer cable, but one hacker, Joe Wyks, managed to pry the top off of the board connector and crimp his new cable into place without soldering. [The latter was the method I used, as it is a little easier on the circuit board. L.S.] The power connector can be adapted with cables made for that purpose, if necessary. That's about all that's needed to run a 720K 3.5. Format a disk using SpartaDOS XINIT, option 7 (DS 80 tracks) and start filling it up! You now have 2880 DD sectors.

> Well.... believe it or not, but its actually a local call to call my
house
> /from/ my house, so I don't actually get charged extra for that.
>
> What is this P: R: connection?

The P: R: Connection was originally produced by ICD, was bought by FTe (which disappeared) but can probably still be obtained from Best Electronics, or B&C, or maybe a couple of other sources. It was supposed to be a convenient replacement for the 850, and in most cases worked well. It comes with two serial ports (R1: is fully-configured like the 850 and R2: is like R2: on the 850) and a parallel port which can be switched off internally by moving a jumper. A second jumper allows for some flexibility in setting line feeds to the printer.

The P: R: takes power from the SIO line, so it works best when installed first in the SIO daisy chain. Some units can only achieve 4800 baud with a modem, but some go all the way to 9600. All should go 9600 over a null-modem cable. Some units have a handler in firmware, similar to the 850's, that is "called" with a one-sector AUTORUN.SYS file from DOS (like the 850) and some need a larger handler loaded from disk before running the terminal program. I still use my P: R: with R1: set up to go to my modem and R2: to a null-modem connection to my PC. I keep the printer port turned off because I want to use a XEtec Graphics AT interface for that, but I know that the printer port (P:) in the P: R: Connection works exactly like the one on the 850.

```
This is an appeal to ALL the readers on this newsgroup.
I'm trying to find the author of GOE, David R. Sullivan.
Last time I spoke with him on the phone he said that he had
about 100 GOE carts done, and he said that GOE compared VERY
favorably to Diamond. I for one would _LOVE_ to have a GOE
cart and support disks, as it appeared to be the most
complete and professional GUI for the Atari 8-bit series.
For that matter, I'd like to have a RAT setup as well. Still
kicking myself for not getting that when it was advertised
in Antic...
If it's any help, David said that he was doing stuff for the
Super NES when I spoke to him maybe 3-4 years ago.

re: Sound quality etc...

Yeah, it's really laughable how long it has taken for the PC to
get to its current level. When the PC was first released, it was
such an obvious piece of crud that, apart from its high price,
I never even considered it when I got my first 800. The current
crop of PCs are merely kludged versions of that original.
Infinitely faster, and with infinitely more memory, but still
the same basic machine. You can't make a silk purse out of a
sow's ear, as the old saying goes. Why it represents 90% of
all machines in the world really illustrates the stupidity of
Humanity to me, for one. Oh well, everything gravitates to the
lowest common denominator anyway.

From: Rohan Langley <rohan@pacific.net.sg>
Message-ID: <3555780F.5C56@pacific.net.sg>
Source record: 62902

Alas, I have been unable to make MULE work on XL-IT. Got something to do with the keyboard not mapping a joystick emu properly. MULE won't let you get past the first screen. (oh, if anyone knows how to fix that then I would be much obliged)!

So I've moved over th Atari800 - an all round great emu. However, one thing that's hassling me is the Numeric keypad joystick mapping. I use a laptop so one can basically forget being able to use it properly.

Question: Is there any patch, setting, or alternative that will map the joystick to an Arrow key - left CTRL key combination?

Any help would be warmly appreciated!

Cheers

Rohan

For tape, type CSAVE and CLOAD. After the command, press RETURN and you'll hear two beeps for CSAVE and one for CLOAD (I think, been a hundred years since I used tapes) Then press REC and PLAY or just PLAY and press a key again. Then it should save and load.

For disks, a disk with DOS on is required (or a cart with DOS). Type SAVE "D:FILENAME.BAS" or LOAD "D:FILENAME.BAS"

For a directory, you can use DOS command or type in the following
CLOSE #1:OPEN #1,6,0,"D:*.*":FOR I=1 TO 1E9:GET #1,A:? CHR$(A);:NEXT I

Happy computing on the most excellent computer. A really fun device this 8-bit Atari. And try assembler, you'll be amazed at what can be achieved on this little computer. Even 486 PC's have troubles doing some of the demos on the Atari

What ruined the home computer was the commercialization of the small computer.
Because 80% of people using computers do *not* care about computers, and
consider themselves intelligent to be able to start MS Word 97, software
makers can get by with inferior and bloated software. Also, software makers
feel unbelievable pressure to "get it out the door" to compete for market
share with all the other software makers.

Most people on this NG use computers because they *really* enjoy computers,
computer gaming, and programming--even enjoy the hardware details of their
machines. But now the home computer has largely been ripped from hobbiest
people because of the *huge* amount of money the software-bloaters can make.

What a joke... those "hard to find" games of yours are worth about 0.50
cents each. I would say that an Atari 2600 Starpath Supercharger is
worth a bit more thank $1.50. Have a Nice day!

Title: "The Fundamental Things Apply"

At the beach apt, Gwynneth is looking through Donna's book of sketches. Gwynneth thanks Donna for letting her stay there and Donna confesses that part of the reason was to keep her (Gwynneth) away from Noah. Noah enters and tells Donna that he has cleared a night at the club for her (Donna) to have a fashion show. Gwynneth suggests (and Noah agrees) that Donna should model also. Donna protests, but agrees) Gwynneth also says she'll get a fashion writer (Chris Asaad) to cover the show. At the clinic, (Wyatt Clinic) a cab driver rushes in and exclaims to Kelly that he has delivered a baby in his cab. (There was alot of traffic on the way to the hospital) The woman walks in with the baby. When Kelly asks the man if he had first aid training, the man responds that he was a doctor in Sarriavo(?), At David's, David returns and is surprised to find Val. David was at court. (gun charges) He plead no contest and got one years probation. David is upset because a $2,000. check he received from a jingle client (men's store) has bounced. An extremely hesitant Val.

I would have to agree with the Atari position that Harris' original Jawbreaker was a copyright infringement. A little mouth eating candy bits in a maze is not suppose to resemble a little Pacman eating dots in a maze? Right....

I remember Jawbreaker for the Atari 2600 and it was actually very good , nice large graphics and the gameplay was different from Pacman.

I got a bunch of files from yogi's site a long time ago, but can't remember how to use them!! some have the extension .gz whatever that is.. and I have a lot of .exe files.. how do I tell atari800 that the dir I want when using the dos.art image is somewhere?? I didn't see too much "this is how you use this" type stuff

I got fractalus working fine now, but bounty bob's recognises the joystick button, but not the joystick directions?? any ideas there??

also I saw there's a bump the screen up/down with some versions of arati800 dos, but it doesn't seem to work..

this is the first real success I've had with any atari emu though.. Great fun playing fractalus again!!
is there a page url with how to use this stuff?

We started with a 16k 400. We expanded it to 48k, bought an Epson MX-80
with Graftrax, and did the keyboard expansion thing. We still have the
unit, but it always suffered from overheating and lockup, so we moved onto
800s- which were by then available at flea markets.

We have had 3 800s, 1 800xl, 1 1050 and a couple 810s die from natural
causes- but we still have 3 or 4 fully functional systems.

What great machines!

Gregm

Thanks for your response,

I no longer have the ATARI and it's suporting equipment, software, and documentation!!

Jim, in WA, picked all of the stuff up on Sunday, 5/10. He builds up and repairs the equipment for the needy kids to have and use.

Ted Giffin

This sounds like your doing something seriously wrong. You need a serial
interface to use APE, it does not produce floppies for your XE.

Guy1015,
Voltage is NOT the problem. The big thing is the space bar control arms
rub the traces on the mylar circuit. This eventually breaks the circuit.
All you need is a conductive ink pen to rebuild the traces. These are
available a many GOOD electronics parts distributors and electronics
catalogs/magazines.

DO you mean an Atari playing Mr Do! or the reall thing? If the latter, do
a search on Mame on the web. Mame is a PC program that emulates arcade
games and now supports several hundred different ones from the late
seventies through to mid eighties. You need copies of the original arcade
ROMs for the emulator to work with but their not usually far from copies
of mame ;-)

XDelusion,
I think I saw something about this as well, but have no info at the
moment. Anyway, what I've done is used a null-modem cable, Bobterm on
the 8-bit and a terminal program on the Amiga. Works pretty well, albeit
sort slow.

Did that too, didn't work. It may have been meant for DCM images, but I haven't tried that yet.
Doesn't matter really, since ZCut did the job already. I'm not going to worry about it.

Later!

Yep, all original. A800, 410 tape drive (but the drive belt is broken), 2 1050's, 1027 printer, all
original carts, disks and tapes (tapes? Arghh!)

Got the 800 for Christmas of '81, the 410 at my next birthday, and I can't remember getting all the
other stuff.

I also got the 130XE in the summer of '86. I use it as the main machine since it's got more RAM,
but I still have to pull out the 800 to play some games, mainly Lode Runner (the XE got the background color wrong. How'd that happen?)

The only thing I've lost is my AtariWriter cart (and my disk of files for it). I loaned it to a
friend, and then lost touch with him over the years. I met up with him again after his wife died
and he said he'd gotten rid of all his XL stuff, and my cart accidentally went with it. What was I
going to say? His wife, a girl I've known since kindergarten, dies of cancer at 25 years old -- I'd
be quite a jackass if I got mad about losing the cart, wouldn't you say?

Oops, sorry to depress anyone. Reminiscing sometimes has a dark side, I guess.

Uh, I hope I'm not posting this twice -- my computer locked up in the middle of typing my other
post.

I've finished typing in the article, and have sent it to Bill Kendrick for inclusion on the UMich
archive. Will advise when it's there.

Yes, it came with the "Pirate's Treasure Chest." I understand that Gardner Computing is out of
business, and if you're looking for the program, Shadow Software is said to be the only distributor
of the disk now. Don't know if the article I typed in would be included with the package these
days. If not, it'd be good to see it on UMich for any other PTC users to get there hands on.

I also understand that the programs on the disk are considered public domain, but the PTC collection
is copyrighted under some distributor's copyright notice. Apparently, if the files on the disk were
released separately, and the PTC name was not used, these programs would be freely available. I've
been proven wrong before, so don't take my word for it.

I know this is an 8 bit newsgroup but this is the only place I can think of posting this. I have an atari 520st (the one without the internal floppy drive), was there alot of these around? all the other 520's I have seen have the drive built in. Also, I need to find a source of the plastic plungers that the key tops fit on. The space bar on this 520 has a broken plunger, it is snapped off halfway down and repeated re-gluing dont work. Anyone know someplace that sells these?

Thanks
Westy

******* Call for ALL Atarians -- Swap Meet in Columbus, Ohio, USA *******

***** NOTE: This is NOT vaporware -- the space IS reserved *****

This is a pre-call to all Atarians everywhere of every platform (game machines and home computers). We of the Atari Computer Enthusiasts of Columbus [a.k.a. ACEC] WILL be hosting a SWAP MEET/SHOW/SALE on Saturday, September 26, 1998 in Columbus, Ohio, USA. We've placed a security deposit and have marked off the calendar!

At this time, we are posting to provide early alert and gain a preliminary response from the Atari community. We wish to hear from all, but WE WOULD PARTICULARLY LIKE TO HEAR FROM (any remaining) ATARI VENDORS who may wish to attend so that we may include notice of their intent in later posts/publicity. We wish to hear from all so that we may better plan this activity and make certain that everyone interested receives a map to the location (in the north central portion of Columbus, just off of Interstate 71). We will shortly be able to e-mail that map in .BMP or other format.

We are not planning on making any money from this: Tables will be available to Vendors and flea marketeers for $5 per table pre-registration. This price INCLUDES door admission for one person. Obviously, we will not be planning a much greater admission price for people just wishing to walk in, look around, talk, and buy! ACEC merely wishes to continue to promote the Atari community as it has since the '70's.

The precise time and other details for the meet are yet to be set; Atari community response will be a prime factor in determining how long the doors will be open and what other shapes the meet takes.

PLEASE FORWARD this note to anyone you know -- any vendor, any collector, anyone cleaning out their closet -- who might be interested in things Atari.

PLEASE RESPOND to:
primary contact: rwarenz@infinet.com
Wayne's World BBS (614) 761-1891
secondary contact: chwbrown@ee.net (Charles Brown)

APE works great for just what you're doing. Tell us exactly what your setup is and someone surely can guide you through this. If I get your message right, you might be trying to read an Atari formatted disk in a PC drive. That's not how APE works.

Remember that these programs only work for disks formatted with Atari true
double density drives like the XF551, not 810 and stock 1050 drives.

The APE cables that connect a PC to an Atari 8bit computer are pretty much the same as the SIO2PC cables. Just don't get it mixed up with the PROSYS cable that works in conjunction with APE. The PROSYS cable is one that connects only the drives to a PC when the Atari computer is not involved.

B&C sells these Atari 600 memory expansions that fit in the back. Listed not as the 1064, but simply as "ACA022 Memory 64K 600XL Atari 19.95" on their web page, I remember seeing them in the store when they were in Santa Clara. The case matches the color and style of the 600XL main unit and simply plugs in the back.

Hi-

I remember a while back a game called Atari rogue a friend had on his Atari 130xe. He said he typed it in from a magazine. Anyway, it was the game Rogue, a D&D style game with ASCII characters but in this case if I remember correctly it used a character set. Does anyone know if this game is still around? I believe the magazine was called 'Antic'.

Is there anyway I could convert the .bas file into ASCII text?

Regards,

Paul Allen Panks

4577. Heartbreak! (+ two 800XLs soon at goodwill/thrift in Rochester, NY)

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-11 00:00:00 UTC
From: Chris Chiesa <cfchiesa@servtech.com>
Message-ID: <35575708.2C7@servtech.com>
Source record: 62940

This past Saturday was my mother-in-law's neighborhood's community garage sale. Foolishly :-), I agreed to my wife's restriction that I only buy, or "come home with," things "if they are things I've been looking for all my life."

I say "foolishly," because, as fate would have it, out of ALL the days I've spent at innumerable garage sales with NO real "restriction," on THIS particular day I encountered, and was FORCED TO PASS UP, something which it BROKE MY HEART to have to pass up: a complete (except for TV/monitor) Atari 800 system and two cardboard boxes full of original peripherals, software, and manuals -- 90% of it in the ORIGINAL BOXES.

There was an 810 disk drive, 850 Interface Module, and Telelink I cartridge with manual (I DIDN'T see a MODEM, however). The "Atari Assembler Editor" in its original box, and (somewhat to my surprise; I didn't realize there were two DIFFERENT products) the "Atari Macro Assembler" in ITS original box. Atari Microsoft BASIC, on its original disk, with its original manual, the package complete right down to the original three-hole-punched black cardboard "disk holder" sheet. The Atari Word Processor -- the one that came out BEFORE AtariWriter, and which very few people seem to have ever heard of, let alone seen -- with its original software AND "training data" diskettes in THEIR original holder sheet in their original Atari 3-ring binder with original manual. A few three-ring binders full of other odd manuals, documents, and printouts (including some that were distinctly non-Atari, but intriguingly Atari-RELATED), and a smattering of other odd carts and cables and whatnot.

Worst of all was the price: one of the boxes bore a sign reading, "TAKE AWAY _FREE!_" Aaaaaaaaauuuuuuuugh!

I say it again: Auuuuugghgghhh! To make a "find" like that, but not be free to take it home...! It burns within me even now. I have half a mind to go back, find that house, and ask them if anybody ever DID take that stuff, and if it's still there, TAKE it and redeem myself in the eyes of the Atari 800 if not those of my wife. I half-hope someone DID take it -- but also I half-hope they did NOT.

The one "saving grace" is that the Atari Word Process WAS something that "I've been looking for, since 1982 if not exactly 'all my life,'" and so I DID see my way clear to take THAT at least. :-) But I can't get out of my mind the image of that 800 and those two boxes, sitting there on the grass by the side of the road... My wife was proud of me for "sticking to the rules," but she doesn't know that it cost me a piece of my Atari-loving soul... :-)

Thanks for listening; I had to tell SOMEONE who would understand. :-)

By the way, I DIDN'T SELL those two 800XL's of my OWN, and the wife'll be hauling 'em off to "the goodwill" -- either the Salvation Army (*) or the Volunteers of America (**) -- sometime soon (as in, probably by this time (4PM EDT) tomorrow). Move fast if you're in the Rochester, NY area!

Is that the same thing as stating that "density and sidedness issues aside, DOS XL diskette format is the SAME as Atari DOS (2.0) format?" I've always assumed this to be the case, and would be very thankful to be corrected if I'm wrong. (E-mail along with posting, 'cause my newsfeed here is seriously defective. I've been in this forum since 1987 and I'd do it for YOU.)

Apropos the original poster whose text I've cut for the sake of brevity... As I understand it, MyDOS 4.x diskette format is a slight MODIFICATION of Atari DOS 2.0 format -- specifically to support subdirectories and "large" disks, I've always assumed. Specifically, one of the directory-entry "flag bits" unused in Atari DOS is used to indicate that a named "file" is actually a (sub)directory, and also the file-chaining "sector link" information has been either ELIMINATED (as I thought for years) or EXPANDED from 11 bits to 16 (as I've only recently caught a hint of). Does anybody here know for sure? I guess I could always dig out the source code and LOOK...

Finally, a programming problem:

For my own instruction, I've cobbled up a very simple Mac/65 program to read-and-display disk sectors. It works nicely for single-density (128-byte) sectors, and if I "knew" the program were dealing with a double-density (256-byte sector) disk I could handle THAT case nicely too. But I've been slowly going crazy trying to make the PROGRAM ITSELF determine diskette density at run time, by "asking the drive." I'm issuing the SIO "N" command to retrieve the drive's 12-byte "configuration table," and the operation returns success status and places data in my buffer -- but the values returned always indicate single density, even when a "known double-density" diskette is in the drive! I tried using the "S" command to retrieve the drive's 4-byte "status" table, but switched to the "N" command when I found the "S" command also not returning the values I expected. I have a few pieces of "real" software that reliably do the trick, but have not yet been able to determine HOW: the one program I've looked at, is a hodgepodge of "R," "S," "N," and "O" commands, reading sectors, querying drive status, querying and setting drive configuration "all over the place." I'd love to hear from anybody who has an idea of the overall logic to be implemented, sequence of commands to be issued, and return values examined.

Dude,

You have to get a grip! I'm not trying to brag or put you down, but it would be a frosty day you know where before my wife dictates to me what I can and can't do.

If she did, I would have smashed the 800 over her head and took the rest home.

re: DOS for 3.5" Xf551 upgrade?

IMHO, SpartaDOS (3.2d and up) is the way to go. However, MyDOS
will also support your upgrade. This is assuming that it is a
standardized upgrade as in the CSS XF upgrade. I can't speak on
any of the others, as I have only experience with CSS upgrades.

FILES even!! LOL!!! I think maybe my system recognised the atr 's as
something else and added the extension to them.. might have to download them
all over again.. 8(((at least they are small!!)

Hey has anyone gotten bounty bob to work?? mine runs, but doesn't regognise
the joystick controls.. it sees the button, but not the movements.. any
setting that will help with atari800 dos? (BTW FINALLY saw the alien last
night in fractalus!! ;))

Oh, and I remember reading somewhere about disk images that had lots of exe
in them.. any net info on getting/making these??

There is a complete description of the mydos file links in the technical
manual. It is available along w/ the mydos source and distribution
at umich. (and yes, the extra bits are used by mydos)

> over the place." I'd love to hear from anybody who has an idea of

I believe that after a read of sector 1, bit 6 ($20) of the first byte of
the drive status indicates the disk is double density. At least it works
for the us doubler.

sega_man (sega_man@yahoo.com) wrote:
: cheaper to buy one from places like www.ebay.com

You're probably right that it's cheaper, and in fact that's what I would do, at least initially.

However, if we just keep throwing these things out when they can be easily fixed by someone who is handy with schematics and a soldering iron, eventually there won't be many left. And at that time, they'll stop being cheap and readily available, which hurts the remaining hobbyists.

I'm not saying you should spend $50 to get an 800 fixed when the going rate on the net seems to be in the $20-25 range for a working one...but maybe we shouldn't just throw out the bad ones. Even *giving* them away to someone who fixes them and resells them at a reasonable price would be better than that.

: the monitor outlet on the 800 is missing. Anyone no where to get one. Or
: at worst where to find one of those boxes to hook up to the TV.

If there is a good source for these, I'd like to know. A couple of
years ago, I bought a mangled, hacked-up cable (with some wires
cut away and wrapped with electrical tape) which works with my
Commodore 1902 monitor. It has a short in it, and I don't really like
using something held together with tape like that. In any event,
it blows the video from a TV set away completely.

I wouldn't mind buying one of these, or maybe two just to have a
spare.

Message-ID: <6j85rfkbs1@pale-rider.INS.CWRU.Edu>
Source record: 62953

I bought a P:R: Connection a ways back, but can't get it to run
without my modem crashing. I've tried it with Ice-t 2.72, and flickerterm
but as soon as I go to the terminal screen, if I type a letter, The screen
fills up with endless repetitions of whithever letter I typed. Now, in the
users manual it says there were Two files, called PRC.SYS, and PRC.REL.
Does anyone know where these files can be found? It says that
you are supposed to load PRC.REL before your modem program if you experience
modem crashes and that should fix the problem. Maybe somebody out there
could upload these two files to the University of Michigan archives ?!?!.
Please....I bet I'm not the only one out here who could use them.
Thanks a lot! Joe
--
Joseph Clark......
Gee....I didn't know you could do that on an Atari.

Depending on what you want to control, the entire job could range from trivial to very complicated. In short, you can get 8 digital outputs via the A/B joystick ports (16 if you use a 400/800). Those outputs can be stepped up to run relays to turn on/off whatever you want, via POKE/PEEK operations in Basic. Also, you get 2 digital inputs via the joystick triggers (4 on the 400/800)- these are contact closures, pushbuttons, limit switches, whatever. Also, on the 800XL, you can use the paddle inputs, which accept a variable resistance input- a potentiometer is a simple example, good for volume/rate adjustments. Radio Shack stocks enough to make this approach feasible.

I can't tell you much software-wise, but the above approach is amenable to Basic at least.

Gregm

4592. Atari Computers/Atari 5200 Auction

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-12 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <1998051202344000.WAA18501@ladder03.news.aol.com>
Source record: 62955

May Auction - Update 3

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Wednesday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Chris... you have a seriously bad case of the PW's. You really should
try to remedy it at least somewhat.

Agreed on bit 6. I have the DOS 2 source, which bears that out. My own work shows some rather strange but in hindsight possibly reasonable behavior with double density disk reads. In sectors 0 to 3, the Atari seems to want to both read and write 128 byte sectors. In sectors 4+, it wants the expected 256. My theory is the ROM bootup disk seeks expect 128 byte sectors only- as in an SD 810. I have no documentation for corroboration, only some tests with my disk emulator via Ataris' Disk Fixer utility, which supports SD and DD floppies. I haven't coded the requisite kludges in my emulator yet, so I also don't have much empirical data either.

I can say, however, the bit 6 of the status command does appear to correctly flag double density.

Unfortunately, I can't comment on myDOS at all. Sorry.

Gregm

Thanks for the info.. You would think by now there would be a GOOD
third party replacement keyboard for the 130XE.. There's nothing like
the system going down in the middle of test papers.. 8-)

Thanks!

I have a 600XL and an 810 floppy to sell. The 600XL's video plug broke, so it has a video cable permenently soldered onto it. It worked when I shelved it years ago, but I tested it out recently and now the audio level is really quiet. :P The video output looks great though... Includes the power supplies and a few SIO cables, the 810 even has the original box... Sorry, no disks or other goodies... $10 + shipping and its yours...

I also have a bunch of mostly Antic magazines, and some other mostly Atari ST stuff for sale. Email for full list, or see c.s.atari.st...

Sorry about the anti spam, its been almost a year since I last posted to a newsgroup, and spam has just recently (mostly) disappeared from my mailbox... I'd hate to invite in another flood of spam...

--
Email should go to a username of lerwick that belongs to yet another annoyed spam victim at a server who is listed in the DNS as freenet.msp.mn.us
And my homepage URL can be easily figured out from my email address

Try asking in comp.sys.atari.st. There's a place called Best Electronics
that sells stuff like you're after but I don't have the details to hand.

4598. Mac Paritition for Shapeshifter

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-12 00:00:00 UTC
From: XDelusion@wcoil.com
Message-ID: <6j94unlkk0@208.10.3.187>
Source record: 62961
Cross-posted to: comp.sys.amiga,comp.sys.amiga.advocacy,comp.sys.amiga.applications,comp.sys.amiga.hardware,comp.sys.amiga.marketplace,comp.sys.amiga.software,comp.sys.atari.8bit,comp.sys.cbm

I am running shapeshifter with za Hard disk file that I downloaded form my friend, the only thing
is that this is terribly slow, and I want to be able to use a Partition form my hard drive instead. ONly thing is that when I use CrossMAC to format a Mac partitition, Mac OS claims not to be able to recognize it, and when I want to Initialize it, it fails!!!

What gives??

Anyone got any clue??
Thankx!

> 16 years
> > >ago?

Yes and no. :-) I still HAVE my original 800, 850, and Percom AT-88
(disk drive), purchased in summer 1982. The 800 started misbehaving (*)
in the summer of '84 or '85, and was soon retired to "lie in state" in
my closet to this very day (it has accompanied me through at least eight
moves (soon to be nine), two marriages (the second currently in pro-
gress), three colleges, and two jobs (the second currently in progress).
I can't bear to part with it; it's like a member of the family! :-)
It's not ENTIRELY sentiment, though: there are still a number of tricks
that just can't be pulled on newer models the way they can on the good
ol' 800. I disturb its rest every now and then for experimentation
along
those lines. Oh, and I'm still using the 850; the Percom disk drive is
a "spare," in case one of my "in-use" drives gives up the ghost.

Over the years several other systems have come and gone as well; just
for the sake of being able to say that "I saw them with my own eyes," I
have at times owned a 600XL, 1200XL, 65XE (lying in dismembered disarray
at a friend's house, awaiting repair-and-resurrection "someday"), and
two
XEGS's. (I loaned ONE of the XEGS's to a now-ex GF's son, and have
never
seen it since. Fortunately, I anticipated that might happen and was
care-
ful to loan him ONLY things that I had DUPLICATES of! Now, I wonder
where
that SECOND XEGS has gotten to...? Hmm...) For what it's worth, I'm
pleased to be able to say that a LOT of these latter machines were
bought
right here on c.s.a.8, and that a COUPLE of them were GIVEN to me FREE.

I also have all my original disks, such as they were: I don't believe I
EVER DID receive an "original" Atari DOS diskette, not even when I
bought

my 800 system "new, from the store." Heck, I have disks containing
Atari
BASIC programs I wrote BEFORE I OWNED AN ATARI! They were written on
FRIENDS' systems, the very ones which caused me to fall in love with the
Atari in the first place.

I never have bought a PC or a Mac, by the way. One of these days my job
will force a PC upon me, but so far I'm holding out!

10 songs? I don't think I got that far with the copy of that demo that _I_ downloaded! Hmm. I may e-mail you for further details...

I've noticed over time that there seems to be a wide variation in people's experience of downloading stuff from UMich. Some people have never had a problem, while others have never gotten anything to work, while still others fall at various points in-between. I myself have usually had GOOD luck, but for some reason can't seem to pull an intact demo off the Net to save my life. Any thoughts on this subject?

use file_disk and partition in SS_prefs
but Boot from file_disk
then format hd partition on MAC side.

> rest home.

Whew. I pity your wife! Been married long? :-) I had a similar attitude toward my FIRST wife... which is a major reason I DON'T HAVE that wife anymore. I have a SECOND wife, however, and am bound-and-determined that I will treat HER BETTER than the first! Hope you can understand THAT idea! :-)

Having said that...

I deliberately put a LITTLE bit of "spin" on the tale, to enhance the intended-humorous effect... it wasn't as much of a "dictation" as I made it sound. More of a mutually-arrived at agreement that I needed to exert a little more self-control than usual over my tendency to bring home all kinds of stuff that I then NEVER USE... :-)

Douglas,
Find a copy of "You Atari Comes Alive" by Richard Leinecker and David
Burd. This should be available at www.myatari.com. It explaines all of
this very nicely and has many examples. It is written specifically for
the Atari 8-bit systems! Enjoy!

Still looking for a few 8bit items:

1) Alternate Reality - The City and The Dungeon
2) Jumpman (not Jumpman Jr.)
3) Shamus and Shamus Case II
4) SpartaDOS cartridge

Also interested in any XL/XE games on cartridge. Have aquired a few over the past few weeks but would still be interested in seeing a listing of any you might
have.

If you have any of the above items and are looking to sell them, or know of someplace that has them, please Email me at "ComDungeon@aol.com"

Thanks in advance!

Al

4605. Must find a fast 040 and scsi controller for 1200!!

I am badly in need of a fast 040 and scsi controller for my 1200, if anyone has one they can get rid oft then please get in touch!

I can trade off my 2000 with OS 3.1 1MB chip PC keyboard & adaptor, disk drive (no face plate) $180

030 40MHZ G-force, 4MB ram,scsi 2 controller (with manuels) $250.00

2019 with rev 7 roms (with maneul) $50.00

Microway flicker fixer (no manuels) $50.00

WIll trade or will sell!!

I live in America by the way....

>using something held together with tape like that. In any event,
>it blows the video from a TV set away completely.

I recently made a monitor cable out of a stereo RCA patchcord and a
DIN jack from Radio Shack. I was very pleased with the result. I've
never seen the video from my 800 as crisp as it is now. The cable
looks professional, and it was easy to make.

If you're afraid of a little soldering, I could probably make one for
$15, including shipping within the USA. (Yes, that includes a little
for my time.) I do recommend making it yourself, though; there's that
sense of satisfaction from making something yourself.

In message 0/47/801, bjajh@buffnet.net writes:

> does anyone have an atari portfolio for sale? andy
There nay be one available at the TAF Flea Market. What are you prepared to pay for one with Memory Cards?

SATURDAY, JULY 11TH, 1998 is the date for another popular Toronto Atari Federation FLEA MARKET! The doors open to the public at 1:00 PM and will be open until 5:00 PM.

This is your chance to come to a bazaar of Atari-related software and hardware where hopefully you can find that peripheral or application for your ST/TT/Falcon or XL/XE 8-bit that you've always been searching for. If there's stuff that you no longer have any use for, get yourself a half-table and sell it! Or, find yourself a treasure! There should be some great deals available.

We are hoping to have some local dealers (and with luck some out-of-town ones) show up for this event, so we've booked a larger hall in anticipation of a good turnout. To help defray some of TAF's costs of the Flea Market the following will apply.

A Half-Table costs just $5.00, The Full-Table just $10.00 each. A Half-Table is FREE to TAF MEMBERS. Dealers are expected to contribute a little more. Admision is $2.00 per non-member family but if you are selling and have committed to a half-table or more, admission is included. Admission for TAF members is, of course, Free. There are benifits of membership in TAF.

The Flea Market itself will run from 1:00 PM to 5:00 PM, with setup commencing for sellors after 12:00 PM, noon, and teardown after 5:00 PM. This should allow enough time for as many people inside and outside Toronto to come to the Flea Market. We will keep you informed on who will be attending this event as confirmations are made.

As usual, piracy cannot and will not be condoned at a TAF Flea Market. Anyone caught selling pirated software or stolen hardware will be dealt with severely!! As always though, remember it's Caveat Emptor.

Refer to the bottom of this document regarding contacting TAF on booking a table or tables and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Gold Room" of the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library Building at 5110 Yonge Street at Parkhome Avenue. Parkhome is about 3 stoplights North of the 401.

Parking garage inside the complex - enterance next to the Novatel Hotel on Parkhome Ave. Those comming by public transport can take the TTC's Yonge Subway, North to the North York City Centre Station, then walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall on your right.

Saturday, July 11, 1998, 1pm-5pm for the TAF FLEA MARKET.

You could make a simple null modem cable and send stuff back and forth
via terminal programs. This requires some level of soldering ability
and figuring out which pins go where in the cable. ;-)

I am interested in Atari 8 bits. I need to know what model to get. Software selection and games is a matter of concern. Also, price and availability.

please reply via email

I have webspace to spare; I could do this, provided someone sent me
the screenshots whenever appropriate... and I have some 8bit game
manuals on my page already (this is a plug)

I love this idea too!

Get an 800XL. Best over-all choice. Hack in the video mod and
upgrade the mem.

*** Please make sure responses are also sent via email.

That would be Rogue, which there are PC ports of if you are looking to
find a version that will run on the PC.. :)

altho if you are looking for an atari version of rogue, there are copies
available for download from the various rogue webpages...! i'm not sure
about exact addresses for rogue webpages, but
http://www2.krisalis.co.uk/wwwdheb/index.html
is the roguelike news page. through the links page you should be able to
find copies of the original rogue for the atari :)

good luck!

From: Frank-Oliver Malisch <fom@mchp.siemens.de>
Message-ID: <6jbjq6$ks1$1@salomon.mchp.siemens.de>
Source record: 62983

Hi,

I do the transfer via via RS232 protocol. This requires an 850 interface module.
Maximum reliable speed is 9600 Baud. For single files you can use Bobterm.
Faster transfer is achieved by transfer of complete diskimages.
You can use diskformer on the atari side for this purpose.

Hope this helps

Frank-Oliver

BTW.: There is a really excellent A800 emulation (in fact a derivate of David Firth's A800 emulator available from Thomas Richter. Unlike ACE and the official A800 it runs almost everything.
The Amiga Version does however need some fixing and you require a really fast processor (at least a 060 or a PPC). It is tested to work on SGI and Sun currently, but most of the Amiga related stuff by David's brother should still work. Still no sound on Amiga yet. Anyone with a PPC Amiga willing to give it a try ?

To get this Emulator go to:

http://www.math.tu-berlin.de/~thor/thor/index.html

Message-ID: <6jbjr4$7ks$1@newsd-199.bryant.webtv.net>
Source record: 62984

Whoa, the infamous AWP. I haven't heard that for a long time. The one really screwy thing that I thought it had is that it saved each page as a separate file. AWP also put returns at the end of each line, and it added alot of extra spaces and control characters when it formatted pages.

It was a real hard program to deal with, AtariWriter was a breeze when it was released!

One feature it had (and at the time, not many IBM or Apple programs had this) was a simple way to change upper case to lower case and vice versa. Back in the days when I saved BBS transcriptions, I HATED those postings from Apple II users WHO KEPT THE CAPS LOCK ON AT ALL TIMES.

AtariWriter still is the BOMB!

Nonsense. Why should I? I like Ataris and I like c.s.a.8bit. I also
happen to think that this strange Atari jingoism is most unbecoming, if
not downright silly.

So the Atari is outclassed by the 64. Well big deal. Both machines are
totally outclassed by Amigas, Macs, and PCs. The Atari is a fine machine,
capable of doing everything that needs doing (and more), and those
capabilities hardly depend on any other computer. Rather than nursing
ancient grudges on tales of vast conspiracies and weird pseudo-technical
innuendo, I suggest engaging in the far more noble and useful pursuit of
thinking about new and innovative machine applications, writing new
programs, and in general looking to the future.

A strong and healthy Atari community can only benefit all 6502 communities.
Lighten up and enjoy the machine!

>Don't go away mad. Just go away!

---
actually, I have added to the upgrade a little... the XF551 will only switch density from DD to SD, so if you have a DD disk and the drive has been reading a SD disk, the DD disk will just NAK out on you because the drive will never try DD. If you are reading a DD disk, you can insert a SD disk and the drive will figure it out OK. This trait is annoying at best, so I added a patch to allow the drive to alternately try either density until it gets it right. This works much better for me.

ADDR VALUE
$0528 $00
$0680 $50
$080F $60

If there isn't (and I don't think there is), I'd be willing to do one and make it availble as PD. Does anyone have any suggestion regarding character layout? In other words, should it map exactly to the original ASCII codes (some of which are not easily usable/accessible on modern PCs and Macs), OR should the characters be remapped in such a way to make it easy to use on modern PCs and Macs?

Note: There is a Mac bitmap font on John Goodman's site (http://www.tiac.net/users/jgoodman/atari/otherresources.html) that is mapped directly to the original ASCII layout, but it is Mac only. I have done several unreleased Atari fonts (also as Mac bitmap fonts) myself. (I don't know how to do bitmap fonts for PCs or if one exists.) A bitmap version of the Atari font is sufficient for most uses since that's all it was to begin with. But a scalable TrueType font (without the "jaggies") would be neat.

When using the upgrade Bob Wooley
(PD) or the upgrade from Bob PUff use
MyDOS 4.5x and choose option O config
drives set it to 80 tracks 2 heads
and double density. The format and
run this disk...

When using SpartaDOS use XINIT 2.x
and chose 80 tracks / double sided
double density. Then for Bob Wooley
upgrade (sector skew) NO and YES for
the Bob Puff upgrade...

The Bob puff upgrade is much faster
and can read IBM/ST diskettes...

Hi,
Does somebody has a MIO 1 MB and/or a
SpartaDOS X cart for sale...

I also look for a US DOUBLER...

Instead of buying I will swap the MIO
and/or SPARTADOS X against a SPEEDY
1050 DS interface which is a
HAPPY-clone kit for 1050 with a DOS
and a Highspeed sector copier on ROM
which will boot when you're booting
the ATARI without a floppy... The
copier will run at 96000bps !

On 12 May 1998 09:32:07 GMT the XDelusion thought deeply about Mac Paritition for Shapeshifter and wrote then:

> I am running shapeshifter with za Hard disk file that I downloaded form my friend, the only thing
> is that this is terribly slow, and I want to be able to use a Partition form my hard drive
> instead. ONly thing is that when I use CrossMAC to format a Mac partitition, Mac OS
> claims not to be able to recognize it, and when I want to Initialize it, it fails!!!
>

If you want to use filedisks, run them on a AFS partition. It is
incredibly fast! =))

Watch your back Amiga RC5, the Atari Force is on the move! (Nothing wrong with a little friendly competition, eh?) If you love Atari, show your support by joining team #3921 today! That is if the stats server ever recovers from the eternal update it seems to be in today... :P (I hope its because they're upgrading the poor thing... :)

No idea what I'm talking about? Go to www.distributed.net. The official team page is at members.xoom.com/8088/rc5/ but is pretty much a placeholder at the moment...

Now where's that Atari client? :)

From: "Sheldon H. Winick" <s.winick@worldnet.att.net>
Message-ID: <6jddmq$5m1@bgtnsc01.worldnet.att.net>
Source record: 63006

Someone recently posted a 'want list' of stuff for an 800XL system. I saw the message but before I could save it and reply, my server went down and seems to have lost all the comp.sys.atari.8bit messages. If the person who posted that message could drop me a copy in Email, I believe I have most of the things he's looking for.

Sheldon

Message-ID: <6jdhag$e0u$1@hades.csu.net>
Source record: 63008

Bill (kendrick@zippy.sonoma.edu) wrote:
: Thanks to his contribution, nearly 70 files are now "named," and can be
: found using the XL-Search search engine:

oops - that should have been 70 MORE files! :)

Add 30 more to that list, thanks to Michael, since this post was made.

Now... for the best news, the XL Search site has been updated slightly
(0K files are now 1K files, there's a "Submit your FTP site" form on the
Feedback page, and a cool picture of an Atari 800 on the from page), and
it now lists ALL 1100+ FILES on Umich!

All of the files which don't yet have blurbs simply have their filenames
as descriptions, but this will of course change as time goes on
(especially if folks like Michael help out like he's been doing! :))

Come visit, sniff around, and enjoy. And REMEMBER: IF YOU HAVE AN FTP SITE
OR WEBSITE WITH ATARI 8-BIT SOFTWARE (esp. that not found on UMich),
LET ME KNOW!!!!!!!!!!

Message-ID: <01bd7edd$6ed64410$64646464@gregm_pc>
Source record: 63009

What about TextWizard? We used it lots- in high school I wrote a sociology paper with it, and my teacher gave me a C because he though the computer wrote it for me. So my dad had a little talk with him and the principal. My teacher regraded my paper and I got a B. At that point I was more interested in DOS 2 internals anyway....

4647. Auction: Atari 8-Bit - 1 Week Left!

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-14 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <1998051402331900.WAA13890@ladder03.news.aol.com>
Source record: 63010

May Auction - Update 3

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Wednesday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

4651. XF551 repair

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-14 00:00:00 UTC
From: Harry Whitmore <HDWHITMORE@worldnet.att.net>
Message-ID: <6jdsm1$5qf@bgtnsc03.worldnet.att.net>
Source record: 63014

Is there anyone that can check out and repair my XF551 disc drive. It started getting real fussy and cycled constantly. When I took the cover off and looked for a problem something must have shorted because it doesn't work now. Don't use the Atari much anymore but I love it too much to give up on it. I also have 2 Indus GT Atari drives that don't work. One was shorted out when the I/O cable got jammed in upside down. The other one just got fussy and quit reading disks.

Hello!

I searched all the sites (hackerz, some mirrors, etc.), but I'm still
missing these games:
Mordon's Quest (adv.), Universal Hero, Space Lobsters, Feud.

Thanks,
--
Jindrich Kubec (kubecj@asw.cz)

Yup, sounds like an Atari light pen. ISTR there were a few 3rd party ones
as well as an official Atari one. Easy to program, even in basic. There
were 2 memory adresses you had to read for x/y and that was about it
I think!

Mark,
If you do this, map it as the full 256 character ATASCII font set.
Scalable would be cool, but not really necessary (at least for me). I'd
love to get a hold of this set!!!

What a kick if it can be done! I know a guy who was attempting it, but work kind of got in the way (shucks!) I belong to an 8-bit user group that wants to put up a Web page and this would make the page look that much more authentic.

4659. Remember JTS? Read this...

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-14 00:00:00 UTC
From: Rob Pagano <robpagano@worldnet.att.net>
Message-ID: <6jevpk$9vq@bgtnsc03.worldnet.att.net>
Source record: 63022

SAN JOSE, Calif., May 11 /PR Newswire/--JTS Corporation (Amex: JTS), today announced that it is consenting to the removal of its Common Stock and 5 1/4% Debentures from the American Stock Exchange (AMEX).

This action became necessary because the Company no longer fully satisfies all the guidelines of the AMEX for continued listing. The AMEX has advised that the last day for trading of the Company's securities on the AMEX will be Friday, May 22, 1998.

The Company expects that a market for its securities will develop over the counter following removal from the AMEX.

Anyone care to wager when they'll file for chapter 11?

That is really net Bob, I had that problem and went back to the old 360 mech. Now I am gonna go back to 720 or maybe even 1.44. BTW, I am still waiting for that mio video ROM image you promised me. Hope to see it soon. Also hope you are feeling better and getting caught up on the workload. New AC soon? Can I drop by for a visit next time I am in the bay area? :)

Ken

Howdy, yall, and a speacial thanks directly to Iain R Laskey (laskey@cix.compulink.co.uk)!! Because, although I might not be able to give specific help on that issue, it's good to see that one brave person's question can open up a world of others (and answers to go with it, of course)...

Reading his post about a light pen made me think - 'GREAT STEAMING CONKERS!' I've got a brilliant Atari device I haven't used in years (Shame on me, my Atarians- head bowed low) and could make use of that amazing invention!

Hmmm...I'll not bore you guys any longer, and get to the point...

Well, my problem is this: I've got an Atari Touch Tablet, and I was wondering...is there anyway I can interface this innovative device to my notebook...so I can draw boring complex chemical structures instead of using my crappy little 'mouse'?

Anyways, great to see you all keeping the Atari light shining in a bitter dark world of pentiums and the like - at least we don't get viruses, hey guys and gals...?

Thanks again, Iain!

Mr. Lover

> Jindrich Kubec (kubecj@asw.cz)

Universal Hero was released by Mastronic in about 1987, and was really great - a kind of arcade adventure where you had to pick up objects, use them to solve puzzles, in quite a large multi-screen maze. The only thing was, the Atari version was ported from an Amstrad I think, and there's a bit where you have to type in a password for a computer, and the Atari version locks up at this point, and you can't get any further. Very sad, because the game looked to be excellent up until then. That might be why it's not on the archives (?)

There was talk a while back of someone hacking the code and fixing it - anyone know anything about that?

Eventually, I was so keen to play the full game that I did something a bit dodgy.... (BRACE YOURSELVES!) I downloaded a Spectrum emulator, and the spectrum, version of the game. The graphics on the Atari are much nicer, and more colourful, although this one did have the merit of working! Still couldn't complete it though - I got stuck on the planet, where I couldn't find something called 'the orb' which I apparantly needed...

Anyway, enough reminiscing! Anyone happen to know what to do next?

I think you guys are right, and I have a recipe for handling your woman when she tries to take your Atari 8bit away or stop you from buying up new ones:

#1 Scour garage sales until you find two Ataris (one as back-up)

#2 Buy a bunch of other useless computer stuff, like old printers, just because they are cheap and might work, modems for the "classic BBS" you plan to start, atari 850's even though you have no real clue what to use them for.

#3 Also buy any four player game carts you can think of. Simultaneous play is important, so not Breakout. Go with Basketball and Asteroids.

#4 Advise wife you are bringing home a few colleagues, and would she please fix snacks.

#5 Purchase 3 twelve-packs of cheap beer, and 3 of you favorite old metal CD's, like Quiet Riot's Mental Health, that kind of thing.

#6 Find 3 equally stupid male friends. This might be tough for some 3 is a lot but you can always find some homeless men or something.

#7 Load them all in your car and drive down by the river and crack open those beers until about 7 are gone.

#8 Stop by a convenience store for nachos because your wife probably f$@ked up the snacks. Get lots of nachos and chip and stuff.

#9 Barge into your home with 3 tipsy, dirty and sweaty grungy guys and yell for your snacks while struggling to hook up the 8bits to your largest TV.

#10 Shove the coffee table out of the way, pass round the beers, sit on the floor, pass out the joysticks, start the metal music and slip Basketball in the computer.

You know the rest.

It seems like I make this post every other month, but my collection gets more and more complete each time, so it it again!

I am looking for the following Atari 2600:

Checkers
Cosmic Commuter
Rampage (NTSC)

Swordquest Waterworld
Crazy Climber
Asterix
Rubik's Cube
Gremlins
Motorodeo
Ikari Warriors
BMX Airmaster

Shootin Gallery
Solar Storm
Subterranea
Wing War

Atari 7800 (lower priority than 2600 games)

Commando
Mean 18 Golf
BasketBrawl
Planet Smashers
Ikari Warriors
Alien Brigade
Summer Games
Water Ski
Tank Command

I have many things to trade at:

http://pilot.msu.edu/user/reicher6/atari.htm

I was looking around the internet today and came across an Atari website that had LOTS of instruction manuals (converted into text files) for 8bit games. It was an excellent site and the person/s responsible should take great pride in the work they have done!

But before I could bookmark the site, I lost my phone connection and got dropped off line. Now I can't remember the address or even the name of the site I was at.

If someone knows the address of a website that has instruction manuals online, please post it.

Thanks much in advance!

Al

As far as your filedisk goes, add 1000 buffers the the drive the filedisk
is on and it will help speed that up tremendously.

It doesn't surprise me. The stock has been sinking all along. JTS was chasing pie in the sky with that small format drive, and now all they can do is compete with the large drive manufacturers (and not very well at that.) We all have 20/20 hindsight, and I guess they could have done something with the Atari property, but they chose not to.

Hasbro will probably do more with the Atari properth (and assumed debt) they have, but probably not as much of the things we, in this ng, would like to see.

The world's first palmtop computer! The Atari Portfolio runs MSDOS applications and comes with a suite of built-in software including calendar, addressbook, text editor, Lotus-compatible spreadsheet, and file-transfer utilities. Plus there are plenty of third-party shareware apps, including games and productivity tools, available for download. This package includes the Atari Portfolio, a parallel port adapter so you can hook it to your desktop for file transfers, a 64k storage card, manuals, and AC adapter. This is a real collectible! Buyer pays shipping. For more info on the Portfolio, check out this page:
http://www.ncsc.dni.us/fun/user/tcc/cmuseum/Portfoli.htm

The auction is at:

: Alas, I have been unable to make MULE work on XL-IT. Got something to
: do with the keyboard not mapping a joystick emu properly. MULE won't
: let you get past the first screen. (oh, if anyone knows how to fix that
: then I would be much obliged)!

I don't know if this is related, but the early copies of M.U.L.E.
(like the one I have) don't work on the *real* 800 XL because of the
joytick mapping. Fix-XL gets around the initial booting problem,
but the program later looks for four joystick ports and bombs.

Later versions (hacks?) of M.U.L.E. boot right up on the XL, no
Fix-XL or four joy ports needed. I believe the recent ATR files
I've seen are the new XL-friendly version, so if that's what you
have, maybe it's not a related problem.

I hope JTS rots in business hell! They deserve it after how they squandered Atari's money, left all of the inventory to sit, did nothing to support the Atari community and then they just have John Skruch walk into their offices and they fire him on the spot. They had absolutely no respect for Atari or its people they deserve whatever hole they fall into and they don't deserve to come out. Right now I need a load of Hard Drives, I could pick up JTS drives from a surplus place for $79 a piece, I'd rather spend $99 and buy Quantums, I tell everyone I know to steer clear of JTS products at all costs.

6502 Assembly Language Subroutines. $4

Machine Language for Beginners, by Richard Mansfield, includes a type-in
assembler, for all 6502-based Commodores, Ataris, and Apple IIs. $4

Motorola M68000 User's Manual. For 68000,68008,68010 & 68HC000 processors.$3

Hardware:

Boca 14.4 faxmodem, no power supply. Since I don't have a power supply
I can't test it, so no guarantees. $5

Prices do not include shipping. I am located in Dayton, Ohio.
Please reply to an422@mvcn.dayton.oh.us.

The mylar replacement from Best seemed to work really well....

If you can switch densities either way, it is your DOS that is
controlling it. The drive will not jump to DD on its own. I use DOS 2.0
in DD all the time. Without the patch, there is no way you can swap
disks. Oh, the drive WILL switch density if you are reading the boot
sectors... Once DOS is in, though, you are on your own.

4690. Re: Remember JTS? Read this...

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-15 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <6jie60$7l9$1@alexander.INS.CWRU.Edu>
Source record: 62854

(Some comments about JTS.)
I dunno. Corporate laws seem like maybe funny.
I remember 'Batteries Included'. It was 'sold' to some company.
It had some money and program rights. The money was taken,
the rights sold to Activision, I think, and the company folded.
Where did all the money go?
1. Atari had $50 million assets.
2. Tramiels 'merge' Atari with JTS.
3. The money from Atari disappears, Hasbro buys Atari (with debt?)
4. JTS goes out of business or loses lots of money.
Where did all the money go?
My wife. She belonged to a 85 year old hospital with and endowment
that could have run the hospital for YEARS with ZERO income.
1. The hospital 'sells' to Columbia.
2. The hospital is about to close because of no money.
Where did all the money go?
The savings and loan $500 billion bailout.
1. Savings and loan companies, by the hundreds are no solvent.
2. The company execs made 'bad' loans to various people.
3. The US Congress steps in.
4. All investors are re-imbursed for their deposits.
5. Three guys go to jain. Milken still has a billion. Keats wasn't
guilty, his main investment was a huge hotel that would have
made investors twice the value of their stock by now.
6. Hardly anyone went to jail. Lots of 'assets' are sold by US
for distress prices , (to whom?).
7. The money is gone. Where did all the money go?

4691. MAC65

Newsgroup: comp.sys.atari.8bit

From: TJ Edmister <damage_x@hotmail.com>
Message-ID: <355C4E34.4A94FFDD@hotmail.com>
Source record: 62855

I am starting to try and learn assembly language. I downloaded this MAC65 thing and I don't know how to do anything. I figured out how to load files with ENTER and LOAD but I couldn't figure out how to make an executable or run the program. Could someone tell me how or point me to some documentation?

4692. Re: Monitor Cable

Newsgroup: comp.sys.atari.8bit

If the cable you are looking is the one with a 5-pin DIN connector in one end and 4 RCA connectors in the other, then here in Lima, Peru, I've seen some still available at a TV/video store.

(fellow looking for mac65 documentation.)
I got some. You can try http://www.en.com/users/russg
Then pick the docs directory. There should be a mac65doc.arc
in that anonymous ftp directory.
If you get a chance, and you try it, please let me know.

4700. Atari 810 disk drives - ?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: right.back@you.com
Message-ID: <6jj5ef$9hn$1@supernews.com>
Source record: 62863

Hi

I've got a couple of 800s and a gaggle of software.
But alas! None of my three disks work.

It's been a long time since I did this, so I have a
question or two. One of my drives is a double density
drive from a third party. It's problem is that the
heads scrape the disk.

Niether of the 800s work right. One could NEVER keep
up a constant rate of rotation. The other...well
It just does not work.

1) anyone know how to fix these things?
2) which if any of the later disk drives are
compatible with the 800?
3) is there a good source for used drives?
4) are there modern drives that can be easily
converted to work on the arari 800?

thanks in advance!

4701. Re: What's your best rank at Star Raiders

says...
>
>I remember reading in a long ago review of Star Raiders II that "by
now
>everyone has achieved a rank of Star Commander and is totally bored
with
>Star Raiders".
>
>My best rank ever is something along the lines of "Warrior Class 5"
-- SR
>is a fairly difficult game.

Well, I played this game forever. I don;t think
I ever got above Warrior.

Mostly I achieved the rank of Chump, Class nothing.

I suppose that was better than wasting my time shooting pool,
but somehow I doubt it.

4702. table of ASCII values

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: "Mr. 8-bit" <erasmus@Atari.domain>
Message-ID: <Pine.GSO.3.96.980516041712.25445B-100000@iglou1>
Source record: 62865

After finding a table of ASCII characters on another newsgroup,
I decided to combine it with similar information for Atari 8-bits
(ATASCII) and produce one chart for reference purposes. (This
might already be in the FAQ files somewhere, but I didn't feel like
searching thru thousands of lines of text in order to find it!)

```

4703. Atari Conversion Data

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: BobKlaas <bobkla19@sisna.com>
Message-ID: <355D4A18.506D0C0F@sisna.com>
Source record: 62866

The evil person that I am, once in a life time I come across someone in the Atari 8-bit world that need help? I have a LADY, 80+ that has used her Atari to do all her personal, biography, ect files. Now those are out dated and her family has purchased her an IBM compatable computer.

I volunteered to convert the files for the lady, little did I know then I would run into Inverse charaters ect...Big deal I am an evil person and diserve this to make amends. I will have the project done within a reasonable amount of time as I do realize I have more time left than does she.

Once this prodject is completed it anyone needs Atari Writer files converted to IBM Ascii format the service is available for a reasonable cost as the setup it in place with the donated space.

If interested contact me e_mail

You say the drives scrape he disk? Have you checked out the pressure pad on the drives? You may have a drive that the pressure pad has been worn down so much that it needs replaced?

I have used 1050 disk drives in good working conditon that can be obtined for $20.00 shipping included.

Source record: 62868

Down hill slide on life and my spouse says I have to eliminate most of my collection.

I have RGb Monitors with cables to Atari Computers, XM301 Modem older acustical modem for the Atari and a lot of spare parts, anywhere from custom chips, to total units. IE: I have an old 400 upgrade keyboard black raised up keys to modern rahter than marlar keyboad. PRC; 2 each Printer cables have at least 2 or 3 each, Nice stuff!

Can put together at least 3 or 4 Atari 8-bit Hard Drive systems for the 800XL or the 130XE anywhere from 20mg to 90mgs or more..open to offers on these.

Upgrade parts have many used 256k Rams, cheap with docs to upgrade you 800XL or 130XE.

Have a couple Atari 8-Bit direct connect printers good working conditon open to offers.

Have several hundred used custom Atari 8-bit chips cheap..ask may have what you need..?

Documentation: have a bunch have to dig it out ask for what you need cheap?

Sorry Wife can't go so this stuff must! Your gain my loss?

4706. Atari Executive???

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: Oz Good <robbh@flash.net>
Message-ID: <6jjntoqia1@excalibur.flash.net>
Source record: 62869
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.programmer,rec.games.video.arcade.collecting

Anybody know who the former textile executive was (is?) who headed
the Warner Entertainment Conglomerate and drove Atari into the
toilet. As described on pages 324-325 of Steven Levy's 'Hackers',
he refered to the hackers who designed and wrote Atari's games as
'towel designers'. Mr. Levy chose not name him, as there wasn't much
good to be said of him, but I'd like to know his name, if he is still
breathing, and what he has screwed up since.

Thanx in advance.

4707. The 9th Adventurer`s Convention

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: Larry Horsfield <Alaric@larryhorsfield.demon.co.uk>
Message-ID: <3Zccf8Ay9UX1Ewzg@larryhorsfield.demon.co.uk>
Source record: 62870

Hello all subscribers to C.S.A.8bit.

If you haven`t already heard about it, you may be interested to hear about the 1998 Adventurers Convention, which is being held in Birmingham (UK) this coming October, as it has been for the last 8 years.

The Convention is being held on Saturday, 24th October 1998, in the Ariel Suite of the Royal Angus Thistle Hotel, St. Chad`s, Birmingham B4, which is at the end of the A38M and easy to get to from all parts of the country.

The Convention runs from 9am to around 6pm and covers all formats from Spectrums to PC`s, including Atari`s. Tables are available if you wish to bring along your own computer(s) and we actively encourage this as we depend on those attending to bring their computers, so the more the merrier! If you wish to bring hardware and/or software to sell you are more than welcome to, but no pirated software please!

The event attracts adventure enthusiasts from all over the UK, including Northern Ireland, and the atmosphere is very friendly and informal. Many of us stay overnight at the hotel and the evenings can be just as lively and interesting as the convention itself! We have yet to welcome anyone from outside the UK to the Convention, but we live hope!

During the day we have the popular "Megapoints" competition running. In this the contestants get 20 minutes playing time at a specially written Spectrum text adventure, with the object of scoring as many points as possible in the alloted time. There are usually cash prizes and special certificates for the 3 highest scores. The adventure this year is being written by Ulsterman Jon Scott, author of various Spectrum text adventures published by Zenobi Software.

Tickets are available now and cost 6 ukp per person if you buy yours before 31st July, 1998. Thereafter, or if you pay on the door on the day, the price will be 7 ukp per person. Tickets may be purchased from:

Vicky Jackson, 128 Merton Hall Road, Wimbledon, London, SW19 3PZ

Please make cheques/PO`s payable to V. Jackson

* * * * * * * *

HOTEL ACCOMMODATION:

The Royal Angus Thistle Hotel has special room rates for those attending the Convention. These include full English breakfast and are as follows:

Single Room: 37.50 ukp per night.

Double/Twin: 32.50 per person, per night.

Please contact the hotel to book your accommodation, NOT the convention organisers. The address and phone number are:

Royal Angus Thistle Hotel, St.Chad`s, Queensway, Birmingham, B4 6HY

Telephone: 0121-236-4211

Don`t forget to inform the hotel you are attending the Adventurers Convention, otherwise you will be charged the normal room rates!

NOTE: The Convention is on the weekend before the start of the Birmingham Motor Show at the NEC. Whilst the hotel have promised to reserve a number of rooms for us, you are strongly advised to book your accommodation AS EARLY AS POSSIBLE to avoid disappointment.

If you have any queries about the Convention, or would like to reserve tables for your hard/software, please contact me at the email address below.

Hope to see you in Brum in October!

Larry Horsfield

4708. Auction: Atari OS User's Manual, Hardware Manual, ANALOG, Antic

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <1998051612085800.IAA04857@ladder01.news.aol.com>
Source record: 62871

May Auction - Update 4

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Wednesday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

4709. Re: FS: Misc Atari software

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: georgeh@mail.rlc.net
Message-ID: <355d9da7.0@news.rlc.net>
Source record: 62872

In article <Et0E74.MJE.0.bloor@torfree.net>, bx557@torfree.net (Justin R. Smith) says:

>Letter Perfect, word prcesor for 400/800. This won't run on an XL/XE. $3

An absolutely first quality word processor program. I used
it as the company's word processor in the early 80s.

GFH

Of course, it's much more sensible to do the internal 64k upgrade mod (2
or 3 chips and a few wires) and keep the PBI free for an MIO or BB.

4716. PM Graphics again

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-16 00:00:00 UTC
From: Eric Cron <ericcron@wwa.com>
Message-ID: <355E5564.659C@wwa.com>
Source record: 62879

Okay, I've been reading Your Atari Computer and COMPUTE!'s First Book of Atari over and over and I almost
understand player missle graphics....

Okay, so I don't REALLY understand how to find the start address of the PM table but both authors use the
following

```
A = PEEK(106)-8
START = A*256+512 (for player 0)
```

Is that about right?

Anyway, they clear player ram by poking all of the bytes between 512 and 640 with 0. I think I can grasp that.

But, I cannot figure out how to fill it. I understand the concept of getting the image from data statements
and using a loop to fill them, but why are both authors adding the vertical position of the player to the start
of player 0? Why is there 128 (or 256) bytes set aside for each player? Is that because they can be very
tall? I understand 8bits wide - but I don't get how tall....

What are the addresses I need to fill for a simple double resolution player 0 whos ram starts at START
(START=(PEEK(106)-8)*256+512)?

Bear with me, I'm almost there....

Eric

From: "Thomas J. Andrews" <tandrews16@delphi.com>
Message-ID: <JrYpFpw.tandrews16@delphi.com>
Source record: 62881

I picked up a printer at a garage sale today--an Epson LX-800. I had one once before, and I really liked it--until the lightning strike took it out.
I saw this one at a neighborhood sale last year for $20, and left it there,
since I had a good printer (a Star NX-1001) and a good backup printer (a Gemini 10X) and I didn't really need another one. This year, the same printer was out there for $5. I couldn't resist any longer. I offered $3;
they took $4. A thorough test when I got home showed it to be working perfectly. Now all I have to do is figure out why I bought it and what to do with it.

Sometimes I can be so weak...

Good! It's a long time since I've used PMG, but the basic principle is that there are 4 "players" and 4 smaller "missiles" (all equating to hardware sprites). You position them horizontally with a poke to their horizontal registers, BUT they actually stretch all the way from the top of the screen to the bottom. To get vertical movement you have to animate the shape yourself by moving it up and down the 256-byte block of memory reserved for each one.

Just a quick summary to keep you on the straight and narrow!

Al:

I know exactly what site you are looking for. It is called "Atari 8-bit Docs, Hints, and Solutions."

I don't know the URL off the top of my head, but you can access it via my Atari & Emulation page called "Back In Time." It can be reached at: http://www.geocities.com/SiliconValley/Horizon/7574

Select the Links option on the index page, then scroll down to the Atari 8-bit links. You will find it there, along with a TON of Atari links, including Computer Dungeon.

By the way, thanks for the great service you provided for the items I recently purchased from you. The Lynx II works great, and Neodesk 4 makes a big difference on my Mega4. I haven't gotten to Geneva yet.

I have Dig Dug for my Atari 400 and it works - but it won't work on my 130XE. Can anybody tell me if a specific translator will do the job, or am I out of luck? Thanks for whatever help anyone can give on this one.

4730. Available: Indus GT disk drive and power supply

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-17 00:00:00 UTC
From: Carl & Delinda Tenney <delitene@netins.net>
Message-ID: <01bd81ac$caf2a6e0$820e8ea7@login.netins.net>
Source record: 62695

I have an Indus GT disk drive and power supply. I can't get them to work. When I turn it on, I think it gives a number 14, or a combination of mixed LED lights that makes no sense. One of these statements is probably true:

The drive works but the power supply does not.
The power supply works but the drive does not.
Neither unit works.
A dread possibility is that one of them burnt out the other.

I don't have the time to try another drive/power supply, and I just would like these to go to someone who may be able to determine if the drive or supply works, and then they could use it or keep for spare. I'm interested in giving them away for free. Please e-mail me at delitene@netins.net if you are interested. If you post to the group instead of e-mailing me, you will not get first-come, first-serve status as to who gets this if more than one party is interested. Thanks!

Out of seriousness or out of sarcasm does that remark originate?

Most Amiga owners know that most of those who worked on the old 8-bit
Atari line developed the Amiga after quitting (or being fired) from
Commodore when Jack Tramiel bought the company in 1984(?).

Any floppy drive made for an 8-bit Atari (with the Atari 13-pin
connector) will work with the 800. A third-party disk drive might work
with a standard IBM-compatible 360k drive mechanism (you didn't say which
third party made your drive. Was it Percom? Indus? Or is it a modified
Atari 1050?)
>3) is there a good source for used drives?
>4) are there modern drives that can be easily
>converted to work on the arari 800?
You could buy or build an SIO2PC cable and connect your Atari to a PC,
using the PC's drives. (Does anyone know if SIO2PC works with DR-DOS
multitasking?)

Net-Tamer V 1.08X - Test Drive

Just found a 800xl

I want to write some software for it and can't find any books or ways to save it.

Let me know what you can do on the prices

Thanks

Evan

Umm... I think you're a bit off here. Jay Miner left Atari while Warner was still running the show because they refused to give him funding to develop a 68000 based computer. I don't know how he ended up at Amiga, but they developed Atari 2600 games & peripherals to fund the design of their computer.

When Jack was ousted from Commodore, he started a new company called Tramiel Technologies Ltd. He hired away many of Commodore's engineers, and they began work on what eventually became the Atari ST.

Meanwhile, Atari Inc signed a deal with Amiga for use of the chipset. The first year would only be for video game use (arcade machines? home consoles?) then after that they could use it in computers.

Then along comes Jack - he buys the consumer products side of Atari, kills all the video game projects and most of the 8-bit stuff, and goes full speed ahead to get the ST ready for market. Thousands of people lost their jobs, but hey are not the ones who designed the Amiga - the Amiga was pretty much done from a hardware standpoint.

At this point, Commodore was stuck with a decimated engineering staff and no next-gen computer design, and Amiga was stuck with an Atari deal that was looking less attractive everyday. So Commodore buys Amiga and the Atari deal goes out the window.

I probably got some of the details wrong, but that's how I understand it.

Man, it's been a long time, but I think I remember that you
could print all the lines to a file. or lprint all the lines
to a file to obtain an ascii listing. If you just save it, you
get the "tokenized" version, and that's not worth much if you
want to edit. Sorry about not being specific enough. Good luck.

4745. Atari 8bit Vs. Atari 7800

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-18 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998051802033600.WAA06438@ladder01.news.aol.com>
Source record: 62708

Just bought the 8bit game "Food Fight" from a garage sale today; came home and decided to try it out. I was very surprised when I started to play it as it didn't seem to be as good as the 7800 version I remembered playing not too long ago.

So, I pulled out my 7800 and plugged in Food Fight and looked at the two games running side-by-side and was amazed at how much better the 7800 version looked and played than the XE version. Much cleaner graphics, much smoother control and movement, and gameplay was much better.

I haven't had a chance to check any other games yet, but has anyone else noticed that a 7800 version of a particular game is better than the XL/XE version?
Or are there any XL/XE games that you've played that you feel are better than the
7800 version of the game?

Al

> Where did all the money go?
See 4. JTS didn't make any money. When firms run at a loss, they survive
by eating into their assets i.e. $50m of the T's cash. When that is all
gone and they still haven't managed to turn it around, no more JTS.

Get a grip. The Tramials shut down Atari and handed the remaining cash over to JTS hoping to get a better return on the money. JTS didn't have any intention of doing anything with the hardware and why should they? Any inventory they got lumbered with was of no interest to them. They make disk drives. What do they care about a dead console and an even deader set of 80's computer technology? They've sold off the patents and rights which was a semi-smart move as that was the only way they'd get anything out of them, cash wise.

Well, I know Microsoft Internet Explorer has a "history" folder which
keeps track of the last x number of sites visited etc. Does Netscape
have this? If so you are in luck. I assume you use Netscape because
you did say "bookmark."

(Somebody wants to know what JTS stands/stood for.)
JTS is Tandon and Shugart, the J part I dunno.
Tandon and Shugart are two of the biggest names in disk
drives in history. Tandon made the first floppies I think
and Shugart founded and ran Seagate for a long time.
These two guys, like the Tramiels, are no dummies.
That's why I find it hard to believe they 'lost' Atari's
50 million in less than a year.

But, the sound in the XL/XE's are far superior to the stinking sound of the 7800. But, graphics are generally better on the 7800 and a console combining the strengths of both would have rocked. Still the Ballblazer cart has a sound chip in the cart, if I have understood correctly, but it still sounds better on the XL/XE's. Take Atarian care

Don't know (or care) what JTS stands for but they were around long before
the Tramiels started to look at them. The phrases 'straws' and 'clutching
at' spring to mind.

About 1984 I wrote an Atari 800 game called Qb, or Cubie.
I released it as freeware to MACE, was delighted to receive a standing ovation for it at one of their meets (ahem... *blush* .. thanks guys). But soon thereafter my system was stolen and I've not seen my game for something like 12 years.
I'm hoping some kind soul could find me a copy of my game, if only that I may lovingly remember the incredible suffering writing it :) Please, please please... anyone who knows of this one, drop me a line.
It was a sort of puzzle game, involving sliding cubes around a board. You had to move the cubes to match a pattern generated for the level. Assorted enemies tried to kill you, and move the cubes away. Sounds dumb, but actually it was a rather neat example of totally inlined graphics, in order that it would run quickly. All viewed in isometric 3D. I'd love to see it again.
Cheers
A

I don't know about that but it should be easy to convert the Atari
character set to ATASCII (it's stored in the Atari in a unique format of
it's own) using the 192 byte table stored in the Atari.Since it's only
128 characters (1k) you'll have to create a second bit-inverted copy and
append that to the first to make a 256 (2k) character set.Then you'll
need a programme that will configure the VGA/EGA card for 8x8 character
display.
(EGA is normally 8x14,VGA 9x16)
Or else double each line to make it a 8x16 (4k) character set.
You could load that with DEBUG.
(VGA character sets are 8x16,not 9x16)

> > Is there anyway I could convert the .bas file into ASCII text?

Load the game with
LOAD "D:AROGUE.BAS"
then you list it to a file with
LIST "D:AROGUE.LST"
.You can load a LISTed BASIC programme with
ENTER "D:AROGUE.LST"
.

I played this a lot.I hacked it so that it beeps when you get hungry
since I kept missing the "Getting hungry" messages.
You should try Nethack for the IBM and UNIX computers if you like Rogue
games.And ADOM if you like Rogue AND Ultima.
Other Rogue-like games include Moria,Larn,Hack.
They all come from UNIX,the source of many a great game.

This game also causes problems with SpartaDOS X since it uses a save
game file and SpartaDOS X has a bug where when programmes that try to
read & write to a file cause the file to keep getting bigger until it
fills the entire disk.I assume that ALL SpartaDOS versions have this
bug.Could someone try out AROGUE with other SpartaDOSes?

4762. Thanks for 8bit manuals page

>Um, offhand, the 7800 is generally the superior platform.

I really wasn't aware of this. Though I've been an Atari user since the 2600 came out, I've never really compared the games before on the various Atari platforms. Food Fight just jumped out at me because I had played it just a week or so before on the 7800 and the XE cart just seemed like a bad version of the game.

In general, what made the 7800 a superior platform to the XE; i.e. graphic chips, sound chips, more time spend developing the games.....

Al

4764. Another 810 question

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-18 00:00:00 UTC
From: right.back@you.com
Message-ID: <6jpg9vofi1@supernews.com>
Source record: 62727

Hi

Sorry about this, but I seem to recall that other disk drives had problems reading 810 disks. I have a couple of old disks. 810 and Indus SD/DD. They work fine together (when they worked). But didn't Atari make a disk drive that would not read 810 formatted disks? If so, which one.

Maybe I should just ask which drives are mutually compatible and which are not?

My real problem is that I have tons of software on 810 formatted floppies. I'd like to access it and I need to know what drive(s) to buy.

Of course how to fix an 810 would be cool too.

thanks in advance

The 7800 comes with the "Maria" chip which gives better graphics than
the GTIA in the Atari home computer system.But it's still shackled with
the 2600's TIA chip for sound so the Atari home computer (with POKEY
chip) has better sound.
(except with Ballblazer,which has a POKEY chip in the cartridge)

Okay, I am sorry this is so long. I have tried to do this as neatly as possible. All of the following is for sale. In fact, all of my stuff is for sale. I am selling most of my video game stuff so if you are interested in more check out my web site at:

http://www.sonnet.com/Fujidom/

Send me e-mail. It all must go. Take advantage of it. Some rare stuff here.

Also, if there is something for the Atari 8-bit that you have been looking for ASK ME, I may have it and just did not list it! Youï¿½ll be sorry if you do not.

My Atari 8-bit cartridges are on another post. Thanks

FEEL Free to make an offer on any or all.

Price do NOT include shipping

-Marlin

I don't know if this will help, but Atari made 2 versions of the 810. Prior to December, 1981, all
810's were made with standard track timings (I'm assuming for accuracy purposes). After December,
1981, all 810's used a new ROM (revision C) that used optimized track timings for efficiency. This
was called "Fast Formatted." A disk formatted on a "newer" 810 couldn't be read on the original
drive (at least, that's how I understand it), and any other brands of drives that relied on the
original 810 spec would (should?) have the same problem.

I, personally, have 3 1050 drives, and have never had any problems reading ANY disks that anyone
else has formatted, no matter what drive they used, so I'd recommend finding a 1050. The only
downside to a 1050, however, is that it's only single-density, but I don't know of any OEM disks
that weren't also single-density, and I'm sure most double-d drives could format to single-d.

I guess the best answer is that there's no one perfect answer :-(

Good Luck!
Steven

4769. Re: Atari 8bit Vs. Atari 7800

The 7800 has the 2600s sound chip - so compared to the 8-Bits and 5200s Pokey it is far worse. BallBlazer has a Pokey in it and it is exactly the 8-bit BallBlazer sound (there is the same sound source-code running). If you hear a difference it is your setup.

Graphically, the 7800 is far more powerful than an 8-Bit and 5200 since both are severly limited in the amount, resolution and color of possible "Sprites" on-screen. The 7800 has a far better approach to that limitation.

I tested the Ballblazer again, and you're right. Same sound, different speed. This is probably my setup, as NTSC and PAL don't update the same amount of times in a VBL. The jazzy 8-bit in the right tempo is great, but I don't know how the 7800 sound in the same speed.

I remember this. Both my 810s have C roms. Was there a "D rom"?

If I came across a perfect answer, I'd probably not recognize it, anyway.
So what you are saying is that your 1050 can read disks someone else
formatted on their 810. Good.

Thanks.

Does anybody know why a Pokey wasn't included in the 7800 in addition to
the 2600 sound chip? I assume cost was the issue but I can't believe it
would have made that big of a difference.

Il> died out. What is your wife to you? Someone to keep the house clean
Il> and cook dinner? What ever happened to it being a partnership with
Il> equal respect for each other?

Well, to me it seems she didn't respect his wish to buy stuff he likes.
But then again, they decided on a rule not to do it.
So why go to sych a garage sale then anyway. Pure masochism probably :)
Wasn't someone who said that one in a while every rule is meant
to be broken? You probably would have to talk like a maniac to convince
your wife that this was really the last time, but he, it was Atari you know.

> If she did, I would have smashed the 800 over her head and took the
> rest home.
Il> Are you for real or just a wind up?

Well, he probably was just joking here.
Anyway, luckily I'm not married and I will probably never will.

Just plain ol' me.

Steven Skaggs was asking why a Pokey sound chip wasn't included in the Atari 7800 videogame system...

Maybe the issue was 2600 compatibility. Since the 7800 was to be backwards-compatible with the ancient 2600, they had to include the 2600 (TIA?) sound chip.

So to also include the Pokey would have been additional expense when they already had a sound chip, and besides sound effects and music weren't considered so important.

FWIW, the Atari 2600 Pitfall II cart had a sound chip in it to play the music.

vs

A few days ago someone wanted info on monitor cable replacements
for the Atari 800, I've been using the monitor cable from a
Sega Master System for some time now and it works great.
Their still available from Sega (I've heard) or some video game
stores.

May Auction - Update 4

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Wednesday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

4780. MonSTEr TAF Flea Market July 11th - update

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3560f546.0@diana.idirect.com>
Source record: 62793

here's an update to the TAF MonSTEr Flea market to be going on July 11th in Toronto:

we have decided to not only make this a chance to sell and buy all sorts of hardware and software for our members as well as those outside the club; we have also decided to make this an event whereby you can learn just what you can still do with an Atari, including the Internet, desktop publishing, scanning OCR, and much much more! So far we have confirmed an Internet demo at the show (using the suite of available Internet clients running under STiNG); we also hope to have a Calamus demo and a music demo going on as well.

We're also hoping to have a number of dealers at the show as well, with people to be announced as they are confirmed. So far we will have a booth for the fanzine ST+ at the show.

We're in the midst of starting a promotional blitz for the show, with advertising in a number of the computer tabloids, the weekly tabloids, and of course on the USENET.

Anyway, here's the original announcement about the show :

Subj : TAF Flea Market July 11, 1998.

SATURDAY, JULY 11TH, 1998 is the date for another popular Toronto Atari Federation FLEA MARKET! The doors open to the Public at 1:00 PM and runs to 5:00 PM.

Yes, here's your chance to come to a bazaar of Atari-related software and hardware where you can shop for that peripheral or application for your ST/TT/Falcon or 8-bit that you've been looking for. Or, if there's stuff that you have no use for, get yourself a table and sell! Get rid of your old stuff or find yourself a treasure!

We're hoping to have some local dealers (and with luck some out-of-town ones) show up for this event, so we've booked a larger hall in anticipation of a good turnout. To help with the costs of the event, the following will apply.

A Half-Table costs just $5.00, Full-Table just $10.00 each. A Half-Table is FREE to TAF MEMBERS. (Dealers are expected to contribute a little more <grin>), with entry to the Flea Market at $2.00 per family (Free to TAF Members).

The Flea Market itself will run from 1:00-5:00 PM (with setup commencing after 12:00 PM and teardown at 5:00 PM).

This should allow enough time for as many people inside
and outside Toronto to show up. We'll keep you posted on
who will be showing up for this event as we make confirmations.

As usual, piracy cannot and will not be condoned at a TAF Flea
Market - anyone caught selling pirated software or stolen
hardware will be dealt with severely!

Please refer to the bottom of this document regarding getting
in touch with TAF on booking tables or finding the location
of the event - and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the
Gold Room of the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre
Library Building at 5110 Yonge Street at Parkhome Avenue.
Parking garage inside the complex next to the Novatel Hotel
Those using public transport can take the TTC's line to the
North York City Centre Station and walk through the tunnel
into the concourse, down to the food court, turn left and
find the Memorial Hall.

That's Saturday, July 11, 1998, 1-5pm for the TAF FLEA MARKET.

Your 810 fix can be found in ST Magazine. All drives built for Atari
will read the single density of the 810, in fact the 810 disk drive was
the only drive put out by Atari that would read almost any unreadable
disk by any other drive. This drive is my favorite for fixing disk
relate problems as it will factually read a disk not readable by the
Trak, Indus, or the 1050, and the XF551.

These old Tanks (affectionately called because they are heavy, big and
cumberson)..will read, write bad sectors ect when others will not touch
the disk, in single density. If your drive is in good working condition
you can fix any disk readable by the other disk drives.!!
Get your drive repaired, aligned properly.

Wife's are funny ladies. When I first became involeve with the compute atcually an Atari 8-bit through my Son. She thought it was great, then I had an electronics back ground and when they attempted to charge me $200.00 to fix a disk drive in 1986, I told them that they were out of their mind!, I took an Ohm meter and went through the drive and found the compunet bad and replaced it for $2.00 plus my time, From there on I was hooked, traced out many circuits with the meter and a cheap scope, finally arrived at the point that I didn't need the Ohm meter or the Ollsicope to repair a unit, coule do it from memory. I purchased old units from Atari Certified repair units that could not fix what was wrong and went from there to where I am today.. If it don't work, then you screwed up, it can be fixed. Anything someone puts out can be repaired you have to have a positave attitued and go from there..

I as well as you do not wish Spam Mail. If you send me a request for an Item the put you regular reply address. I do not compile lists for other ares to spam you back. I have had nothing but rejects with the mail request for items I have up for sale ect, with crapo return address and as spam gets to be a pain in the butt!! Congress is working on this and using my own address have not received more than 4 spams in the past 4 months. You reject these and tell them to remove you from their list and they go away...you want something from me don't use no spam address as I am tired of getting rejects on mail sent..

Now if you want to reach me by Mail..
Send leter/ money order/check to
Bob Klaas
4267 W. Midway Dr.
Salt Lake City, Ut. 84120.

Phone 801-967-7400 after 3:30pm MDST!!

I have more items available than what I post so you will not loose out on a purchase unless I specify it is a one only item..!

I have 3 rooms in the house that hold Atari 8-bit Items, actually 4 she doesn't know about one..plus a 12x12 storage area under the Deck and a 10x12 shed. If I get the stuff out of the house she is satisfied.

I have a nice 400 computer, upgraded to 48k and an typeable keyboard modification..$20.00 shipped. Has power supply and basic cartridge will throw in 2 extra carts game type.

I had a joker ask me what I wanted for all I have available, honestly I told him the shipping charges would break him. If someone is seriously interested in buying me out, hardware, software, Copyrights ects I will seriously intertian offers. I own all rights to BBS Express! Professional from version 1 through 5.0b. I own Hard Back and Restore all rights. I own DK-Utilities for the Black BOx and The MIO. Have source code on these. I have distribution rights on the US Doubler from FTE and own all rights to Sparta Dos 3.3c, in Disk Format or on Cartridge
along with several files as P/D CD-ROM ect..if seriously interesetd can be bought out.

Agreed. Marriage is supposed to be a two way street - she should have
respected his interests/wishes and been more supportive of them.

> to be broken? You probably would have to talk like a maniac to convince
> your wife that this was really the last time, but he, it was Atari you k
> now.
I've got the opposite problem - it was my wifes idea to blow our honeymoon
savings on a projection TV rather than an Alaskan cruise, whale spotting!
She's also the prime mover behind us upgrading from Dolby Pro-logic to
Dolby Digital/AC3 with the sound system! She's not keen on computers
though but puts up with me spending ages tinkering ;-)

There's no mention of a "D rom" in any of my tech stuff, but I guess it's possible. The only reason
I doubt it is that the 1050's were coming out around 1982-83. Chances are, if there was a "D rom,"
it went into the 1050.

Quite often, you have to blame the programmer, NOT the hardware.
The Atari 8-bit computers can do fabulous things, but unless you know the machine very well, you'll never program something technically above average.
Atari 8-bit versions of Asteroids, Ms. Pac-Man or even Food Fight aren't good examples of programming (check out the C64 version of Ms. Pac-Man to see what I mean!).
Several games are better on the computer: a program like Karateka (which was developed years after the original version) is a real loser on the 7800.

Can't say i've ever played that game, though it looks interesting. If anyone finds a copy, send it to me as well :)

4794. Re: Re : Atari 8bit Vs. Atari 7800

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998051915291800.LAA14008@ladder01.news.aol.com>
Source record: 62807

Just wanted to say "Thank You" to everyone who has posted responses in reply to posting about Food Fight on the 7800 vs. Food Fight on the XEGS.

I've learned alot from reading your replies. Though I've used Atari products since the 2600 was new (and still have 8bits, ST's, TT, Falcon, Portfollio, 7800, 5200, Lynx, Jaguar, et al) you can always learn something new.

Thanks again to everyone who responded!

Al

4795. Atari 7800 vs. XL/XE vs 5200

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998051915343300.LAA14378@ladder01.news.aol.com>
Source record: 62808

From what I've gathered over the years, the 5200 was nothing more than a "Atari 400 without a keyboard". After reading the posts about the 7800 vs. XL/XE,
I was wondering if there were any differences between the 5200 and the XL/XE as far as any games being better or differences in the hardware etc.

I've not noticed any real differences in the games I've played recently (Pac-man,
Frogger, and a couple of others) but its made me curious. Since I've decided to stay home over the three day weekend (except for some outdoor activities), maybe I should take some time and load up the 7800-5200-XEGS and see what differences there are in the same game for each system.

In regards to your question about the 7800 not having a Pokey sound chip:

I haven't been able to dig up solid evidence yet, however it is my belief that the "AMY" sound chip that the Tramiels were trying to stick in an Atari 65XE and call it a 65XEM may have very well have been a sound chip intended for the Atari 7800 to be installed into cartridges for super sound. The reason I believe this is two-fold: 1st, the Tramiels only spent money on the ST's for new chip developments, anything for the 8-bits were re-hashed technology already designed from the Warner era, secondly the 7800 was rumored back in 1984 when it was supposed to have been released to have had an all new sound chip for phenonmenal sound. These two reasons lead me to believe that the AMY sound chip was meant for the 7800.

Source record: 62810

In many ways the Atari 7800 is superior graphics wise to the Atari 8-bit systems, the Maria chip added a lot of power to the 7800 in terms of graphics. If a cart was equipped with a Pokey chip, then sound was no problem either.

Well, the XL/XE is really just a "400 with more RAM." Hardware
differences between the Atari 8-bits are subtle and mainly have to do
with how memory is handled. The only Atari 8-bit system to gain
hardware over the 400/XL/XE/5200 is the 7800 which has a better sprite
engine, but lacks the Pokey sound chip.

>What's an Atari ?

Now THERE'S a question!

The consoles:

Pong. The Atari VCS with that awesomely bad joystick. Then the 7800 came along. That was kinda nice. Anyone remember "The Adventures of Cute"?

The computers:

The Atari 400 started it all with it's podgy design and membrane keys. Then..erm...was it Jay Miner? Anyway, he designed the 800 - a seriously wicked machine for it's time.

Then, after the XL 8-bit range, came Atari STs. The healthy competition to the Amiga. In fact, I loved Atari STs so much, I didna change to the Amiga until 1991. But I've never looked back.

Anyway, the Falcon was a technically sound machine backed up a failing company.

And finally - "Atari Teenage Riot". Oh dear.

It's strange how die-hard Amiga users have become with their machines. Four years have passed silently and yet advocacy is still alive as ever. Where would I be without my morning fix of Arami, Viper, Corn and Jack Andrews, Pete Kittel and the rest of them? :)

The Atari's still cool by the way....

From: rldetlefsen@delphi.com
Message-ID: <5JYoGiL.rldetlefsen@delphi.com>
Source record: 62816

I find the big problem with 130XE keyboards, besides the flimsyness, is the connector to the main board tarnishes through. But, where ever the trace breaks are, the silver pen and a light box make quick work of repairing it. And I finish by overcoating the pen fix with an acrylic (spray if the area is big enough).

From: rldetlefsen@delphi.com
Message-ID: <5pQJG8I.rldetlefsen@delphi.com>
Source record: 62817

For Mydos, byte 1 of the dir entry, bit 4(7-0) is used to specify sub-directory. The forward sector reference bit were expanded with the file number bits so 65535 sectors could be referenced. And once folders started being used, to which folder did a file #32 belong if an error occurred. So file numbers were not used(but can be useful if the directory structure were changed).
Rick D.

4805. Re: Mapping Joystick to Arrow keys instead of keypad in Atari800

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: rldetlefsen@delphi.com
Message-ID: <xLZqOoN.rldetlefsen@delphi.com>
Source record: 62818

The only way to look for joystick ports is to have the user press fire for each stick connected. More than likely, the program was using part of the OS that changed in the XL line.

Hey guys.. I have quite a few of the old synapse game posters.. I'm looking to complete a collection, and post the grpahic on the web.. anyone have any of the old boxes, ads, posters, ect?? I'll list what I have as soon as I can go throuhgh them, but think I'm missing Shamus, Claim Jumper, Protector, Nautilus, and possible slime.. also any 64 based games as well (I collected the old atari ones..)

The box art was GREAT and it'd be nice to have these as wallpaper, or as a screen saver..

Anyway, if anyone has ANY, please reply..

I am in charge of making copies of a video of a play that my wife was in. I thought it would be neat to use my Atari to have scrolling credits at the end. Has anyone written a program to do that? Where would I find it?

I suppose I should break down and write it myself, but I'm not sure I have time to do so.

Isn't there a mention of a new ROM that was never released in the Inside
ATARI DOS manual? It was never released, but could do things like format
individual tracks and other more "hacker-like" features.

tony

4812. Writing ATARI DS/DD disks on PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: alumno20 <alumno20@li.urp.edu.pe>
Message-ID: <356212DC.FD917E65@li.urp.edu.pe>
Source record: 62825

Here are some notes which may prove useful, comparing ATARI and PC
floppy disks.

Common densities in the AATARI 8-bit world are:

single density (SD), enhanced density (ED) and double density (DD). The
standard disk size is 5,25", and though most drives are single-sided,
there are others (mostly the latest ones) which are double-sided.
SIngle and enhanced density use 128-byte sectors, DD uses 256-byte
sectors. SD uses FM encoding, ED and DD use MFM.

Summarizing:

Density sides TPS SPT BPS enc total bytes
SD 1 40 18 128 FM 92160 (90K)
ED 1 40 26 128 MFM 133120 (130K)
SS/DD 1 40 18 256 MFM 184320 (180K)
SS/DD 2 40 18 256 MFM 368640 (360K)

OTOH, the common densities in the PC world are:

single density (SD), double density (DD) and high density (HD). The
satndard disk sizes are 5,25" and 3,5", though I haven't ever heard of
any 3,5" SS/SD disks. Most drives today are double-sided, only in the
first times there were single-sided SD 5,25" drives and DD 3,5" drives.
SD used 256-byte sectors, both DD nad HD use 512-byte sectors. Again
here, SD used FM encoding, DD and HD use MFM encoding. There's another
density called quad density (QD), only common in 3,5" drives, which also
uses 512-byte sectors and MFM encoding, but it hasn't become widespread.
We must note that these sector sizes are just the standard ones, since
the controller lets you format your disks in other custom sizes.

So, summarizing for the PC/DOS:

Density size sides TPS SPT BPS enc total bytes
SD 5,25" 1 40 9 256 FM 92160 (90K)
SS/DD 5,25" 1 40 9 512 MFM 184320 (180K)
SS/DD 5,25" 2 40 9 512 MFM 368640 (360K)
DS/HD 5,25" 2 80 15 512 MFM 1228800 (1.2M)
SS/DD 3,5" 1 80 9 512 MFM 368640 (360K)
SS/DD 3,5" 2 80 9 512 MFM 737280 (720K)
DS/HD 3,5" 2 80 18 512 MFM 1474560 (1.44M)

What else? Let's take a look at how the drive writes to the diskette.
We'll analyze this from the point of view of the PC, since the interest
here is in writing a program capable of reading/writing ATARI 8-bit
disks using a PC 5,25" drive.

Normally, the PC writes to a 360K disk in the following way:
it begins from track 0 (outside) at side 0 (top), the continues with
track 0, side 1 (bottom), the comes track 1, side 0, then track 1, side
1, until it finally reaches track 39 (innermost), side 1 (bottom).
We end up with 720 sectors of 512 bytes each, numbered from 0 to 719.
Of course, we can program the controller to use 18 sectors per track,
each of 256 bytes instead, and they would be then numbered 0 to 1439.
The formula for calculating the logical sector based on the sector,
track and head is:

Lsec=(track*2+head)*18+sector

And the formulae for calculating the track, head and sector corresponding
to a logical sector would be:

sector=Lsec mod 18
head=(Lsec div 18) mod 2
track=(Lsec div 18) div 2

The "Util"program, which reads/writes ATARI 8-bit SS/DD disks, reads
and writes to the disk in the following way:
It begins from track 0 (outside) at side 0 (top), then goes on with
track 1, side 0, until it reaches track 39 (innermost), side 0 (top).
But it also can read/write DS disks; it does this in the following
way:
The first (top) side is read like on a SS disk, then, after reaching
track 39, side 0, it returns to track 0 (outermost), side 1 (bottom),
and goes on with track 1, side 1, and so on until track 39, side 1.
The formulae for the logical sectors in this case is:

Lsec=(head*40+track)*18+sector

And the formulae for calculating the track, head and sector corresponding
to a logical sector would be:

sector=Lsec mod 18
track=(Lsec div 18) mod 40
head=(Lsec div 18) div 40

The problem here is, the ATARI 8-bit DS drives use a different method:
after reading side 0, side 1 is read BACKWARDS, which doesn't only mean
that the tracks are read starting by track 39, side 1 until reaching
track 0, side 1, but also that the SECTORS in each track are read
beginning from sector 17 and ending at sector 0. Don't ask me why.
From the ATARI 8-bit point of view, a DS disk written using Util will
have sectors 721-1440 reversed (let's also remember that ATARI 8-bit
computers begin numbering sectors at 1 instead at 0). Although one
can write a program to read and reverse those sectors, if you already
had data on them, it may have been overwritten by Util. So what's
needed is to change Util to write those sectors in the proper order.
From the PC point of view, to properly write the sectors on an ATARI
8-bit diskette, we would have the formula:

Lsec=head*1439+[track*18+sector]*[1-2*head]

And the formulae for calculating the track, head and sector corresponding to a logical sector would be:

head=(Lsec div 18) div 40
track=[(Lsec div 18) mod 40]*(1-2*head)+39*head
sector=[Lsec mod 18]*(1-2*head)+17*head

Just as a sidenote: remember also that ATARI 8-bit computers write data in a way that's complementary to the PC; that is, it uses for a "1" the value the PC uses for a "0", and vice-versa. This can easily be solved by complementing the value after reading and before writing to disk.

So far, I haven't been able to decipher the source code from the Util program in order to patch it. The author's help -or anyone else's- would be greatly appreciated.

4813. Writing ATARI DS/DD disks on a PC drive

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: JTKirk <mcheca@li.urp.edu.pe>
Message-ID: <35621393.D8B4A633@li.urp.edu.pe>
Source record: 62826

Here are some notes which may prove useful, comparing ATARI and PC
floppy disks. I'm posting this again because first I had not noticed
I wasn't logged in at the time of the posting.

Common densities in the AATARI 8-bit world are:

single density (SD), enhanced density (ED) and double density (DD). The
standard disk size is 5,25", and though most drives are single-sided,
there are others (mostly the latest ones) which are double-sided.
SIngle and enhanced density use 128-byte sectors, DD uses 256-byte
sectors. SD uses FM encoding, ED and DD use MFM.

Summarizing:

Density sides TPS SPT BPS enc total bytes
SD 1 40 18 128 FM 92160 (90K)
ED 1 40 26 128 MFM 133120 (130K)
SS/DD 1 40 18 256 MFM 184320 (180K)
SS/DD 2 40 18 256 MFM 368640 (360K)

OTOH, the common densities in the PC world are:

single density (SD), double density (DD) and high density (HD). The
satndard disk sizes are 5,25" and 3,5", though I haven't ever heard of
any 3,5" SS/SD disks. Most drives today are double-sided, only in the
first times there were single-sided SD 5,25" drives and DD 3,5" drives.
SD used 256-byte sectors, both DD nad HD use 512-byte sectors. Again
here, SD used FM encoding, DD and HD use MFM encoding. There's another
density called quad density (QD), only common in 3,5" drives, which also
uses 512-byte sectors and MFM encoding, but it hasn't become widespread.
We must note that these sector sizes are just the standard ones, since
the controller lets you format your disks in other custom sizes.

So, summarizing for the PC/DOS:

Density size sides TPS SPT BPS enc total bytes
SD 5,25" 1 40 9 256 FM 92160 (90K)
SS/DD 5,25" 1 40 9 512 MFM 184320 (180K)
SS/DD 5,25" 2 40 9 512 MFM 368640 (360K)
DS/HD 5,25" 2 80 15 512 MFM 1228800 (1.2M)
SS/DD 3,5" 1 80 9 512 MFM 368640 (360K)
SS/DD 3,5" 2 80 9 512 MFM 737280 (720K)
DS/HD 3,5" 2 80 18 512 MFM 1474560 (1.44M)

What else? Let's take a look at how the drive writes to the diskette.
We'll analyze this from the point of view of the PC, since the interest

4815. XF551 upgrade to DS/HD 3,5"???

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-19 00:00:00 UTC
From: JTKirk <mcheca@li.urp.edu.pe>
Message-ID: <356214C9.9054ACD4@li.urp.edu.pe>
Source record: 62828

I came across this article the other day, while searching for info on
the XF551 controller (the WD1772), and thought it may also be applied to
the ATARI 8-bit computers.
I also took a look at the XF551's tech specs, and that's what I found out:

Processor: 8040/8050AH at 8.3333MHz (docs say 18.33, but it's a mistake)
Disk controller: WD 1772 02-02 (I opened my drives and looked at the
complete code)
SIO data rate: normal: 19040bps (NTSC)/18866bps (PAL)
high speed: 38908bps(NTSC)/38553bps (PAL)
Rotaton rate: 300RPM
Power source: external power adapter, 9V AC, 31VA, 60Hz (NTSC)/50Hz (PAL)

perating modes: Single Dual Double Density
Number of sides 1 1 2
Total tracks 40 40 80
Sectors per track 18 26 18
Bytes per sector 128 128 256
Total bytes 92160 133120 368640
Encoding method FM MFM MFM
Transfer rate 125000bps 250000bps 250000bps
Acces time: (maximum)
track to track 40ms 40ms 40ms
motor start 1000ms 1000ms 1000ms

After checking the following article and comparing with the specs for the
XF551, I began to think tht it could also apply to the XF551 for making
it a HD drive. Read the following and then express you opinions. The
original authors'names should appear down there within the text.

----------[begin quote]----------

Introduction and Notes for adding High density disk drives to the Atari ST

The first thing you must do, is to verify that your existing HDD controller
IC is a suitable one for the modifications. The controller on the Atari ST
is a Western Digital WD1772 and carries a suffix (usually) of 00-02 or
02-02. As it is explained in the following texts, the original chip is
designed to run at 10MHz and only the 02-02 chip will handle the higher
clock speed of 16MHz, so ensure that you have a compatible HD controller
first.

There are no major problems with running two disk drives either one of each
or two high density drives but a little jiggery pokery is required to get
it all rolling properly. The type of HD drive you select will depend upon
you but some are easier to work with than others - it is essential that you

get a drive that will handle the full Shugart specs and not one of the (increasingly common) PC type HD drives that has limited functions. The HD drive MUST have the ability to send out the HD select signal on it's interface connector. The PC does not use this normally as the HD select is controlled by the PC host card and tells the drive what kind of disk is inserted (this is the reason that the PC can mess up a HD disk by formatting the media with the wrong data rate).

For full compatibility you'll need to gate the HD select signal with the drive select lines so that you can mix both high density and normal density drives on the same bus.

Some of the later series of HD drives have a pull-up on the HD select line that will stop you accessing the normal 720k drive as a second unit. This can be overcome by swapping jumpers (assuming you get a drive that can be configured properly) or by changing the pull-up to a higher value and arranging gates so that it is driven and held low for non high density disk access.

You may also experiance timing problems with some obscure makes of drive, so be careful to make sure you know what the drive unit you are buying can/can't do.

Finally, if you boot from the A: drive and you make this your high density one then be aware that you will need a small "autoboot" program to set the step rate BEFORE you can boot from a high density disk. This program MUST reside on the first track of the disk or the boot will fail for resons explained below
---

How it Works

Basically the 720k and 1.44 meg disks drives are compatible in as much as that they both have 2 sides and 80 tracks. Now the important difference is the speed at which they write to the media. With 720k disks, the data is written out by the drive at 250k bits/second - this is known as "double density" and uses MFM encoding. A high density drive uses exactly twice this speed at 500kb/s and hence, writes twice as much data to the media. This is layed down by the format program as 18 sectors (instead of 9 on a 720k) per track of 512 bytes per sector. This faster rate is still MFM encoded and is known as "high density". There is yet a faster rate again at 1Mb/s that is used on the IBM machines and creates disks of 2.88 meg capacity but a new controller IC would be needed for this (anyway, the disks are too expensive yet) and it's known as "quad density" and there is an older standard known as "single density" which was half the data rate of the original 720k we discussed at 125Kb/s (remember the old CPM machines and things).

OK, you've swallowed all that (what you haven't....) now consider that since the physical interface is the same and only the data rate changes (a high density drive unit switches it's data rate up to 500kb/s when you plug in a disk with an extra hole) between 720k and 1.44 meg disks, it becomes

easy to see that if we send the data at the same speed as the high density standard, then we can talk to high density media. How do we do this - easy, double the clock rate to the disk contoller chip. It's normally run at 8MHz, so run it now at 16 MHz and presto... you have your high density interface. You can pick up a 16MHz clock in the Atari from the video shifter.

One unfortunate side effect of doing this, to which I referred earlier was that since the data rate has changed and the speed doubled, then it now takes the HD controller chip half the time to carry out any operation than it did before. Now this means that effectively, the STEP rate of the disk drive (a function of the controller chip) is now halved from 3ms to 1.5ms (and I haven't yet found a drive that'll go this fast). So the problem when booting from a HD disk, is that you must load a little utility that will change the STEP rate (programmed by the operating system) to 6ms (which when clock doubled becomes 3ms).

Now, this utility has to be small enough to fit on track 0 otherwise the disk drive will try and step out to the second track at 1.5ms (which it won't do) and the drive goes out of sync. Quite a number of programs incorporate the ability to change step rates and a small program can be written to do the job (I have written such a small utility if anyone wants it).

Compatability

There are one or two commercial 720k disks that complain and refuse to load if tried in a converted machine with a 1.44 meg as drive A: and if you're a games freak then it is probably better that you make the HD unit, your B: drive to maintain compatibilty. Once written and formatted, TOS takes care of how many sectors per track there are and I have found no (serious) problems at all with two HD drives fitted to my Atari Mega 3. One last point to bear in mind is that a lot of (both commercial and PD) utilities were written to allow the use of 9, 10 or 11 sector formats, so these will not work with an 18 sector disk and any cleanup/repair/disk doctors that can't handle HD media, will most probabyly foul things up for you and make an even worse mess - you have been warned.

Oh yes, forgot to mention you can handle 5.25" HD drives as well but you need to fit an external switch (the 5.25" HD doesn't have an HD select line OUT)

Happy hacking.....
Martin GW6HVA @ GB7OSP

That's all very interesting (and no doubt useful for MS-DOS)... but--no
offense--we're talking about TrueType fonts. I know you're not a big fan
of computers that use a graphical user interface, so FYI:

TrueType is a font format developed by Apple and Microsoft about 10 years
ago as an alternative to Adobe's proprietary PostScript format, and is now
the standard font format used by both MacOS and Windows. TrueType fonts
are stored as scalable mathematical outlines of the character shapes (as
opposed to discrete bitmaps) so they can be printed or displayed on-screen
at arbitrary sizes without needing a different (bitmap) font for each
size. Put another way, TrueType fonts create bitmap fonts on-the-fly at
arbitrary sizes.

Arguably, the Atari ATASCII set would not make a lot of sense as a
TrueType font, since it is essentially an 8-pixel-tall bitmap font to
begin with. Most TrueType fonts are based on real typefaces which are not
pixel-based, and therefore the more pixels and the smaller the pixels, the

more faithful they are to the originals. The Atari characters are pixel-based, so using them bigger or smaller is simply a matter of enlarging or reducing the pixels.

My plan is to create a "real" typeface that looks like the Atari set when it is rendered at 8 pixels tall. When it gets larger, instead of getting more jagged, it gets smoother. This will be especially nice when printed on laser or inkjet printers (Antic and A.N.A.L.O.G. could have used something like this! :-), but will also be nice in larger sizes on-screen. For purists, I am also doing a version that has the classic jaggies no matter what size it's used.

(BTW, getting the characters out of ROM is the easy part and only the first step.)

I thought my old 800 was dead after our cat (RIP) knocked it off a high shelf. Turned it on--nothing. I'm not a hardware wiz, so I set it aside figuring I'd get it fixed later. Didn't toss it, though. Five years later it occurred to me to open it up to see what the damage was. To my surprise and chagrin, the RAM and ROM boards had just been knocked out of their sockets. Pushed 'em in--bingo! Works fine now. I had a similar experience with my 850 (same cat, too ;-) and fixed it after my success with the 800.

Hi Steven,
Somewhare around here I have an "E" ROM for the 810. As far as I
remember, it changed the step rate and skew plus allowed you to copy
some copy protected software. Software for it came on an Atari disk
and I was told it was an Atari in house setup. I took it out when I
put the Happy in.

Just look at 2600 Pac Man and Ms.Pac Man for a good example of this.

> Atari 8-bit versions of Asteroids, Ms. Pac-Man or even Food Fight aren't good
> examples of programming (check out the C64 version of Ms. Pac-Man to see what I
> mean!).

I thought that Asteroids and Ms.Pac Man were faithful to the arcade
version.

Well the Commodore could display 8 sprites rather than 4 played and 4
misiles.And they could have 3 colours compared to the Atari's 1.
(but only one colour is unique,the other two are shared amongst all the
sprites.But,of course,horizontal interupts can fix that on a per-line
basis)
On the Atari you have to combine two players to get three colours and
the thrid colour is a mix between the colours of the original two.
(That is,You can't control it directly)
And if you use 1-colour sprites then you get double the horizontal
resolution.(320x200 sized pixels compared to 160x200 & 160x100 for the
Atari)
And it was a lot faster to move them around since all you did was tell
the graphics chip the co-ordinates to display them at rather than having
to move a dozen or so bytes (a byte for each line) to move them
verticaly.And the same goes for sprite animation.

> Several games are better on the computer: a program like Karateka (which was
> developed years after the original version) is a real loser on the 7800.

Well,of course,the computer has a disk drive for un-limited storage and
a keyboard and more RAM.But keyboards and disk drives would mean having
to install a POKEY chip.POKEY would also allow you to have a tape drive
for SuperCharger-like games.
(most 7800s don't like the SuperCharger)

I still can't understand why no games (especially RPGs) on the Sega
Saturn use the keyboard.

But file numbers are used if the disk has 720 (or less???) sectors.This
means single density (90K) and double density/256bps (180k) disks.So if
you don't create sub-directories the disk should be DOS 2 compatible.

> offense--we're talking about TrueType fonts. I know you're not a big fan
> of computers that use a graphical user interface, so FYI:

Yeh,I know about re-scalable (vector?) fonts;I'm not totaly senile.As
for a GUI,I have to use X under Linux which isn't so bad until I have to
run NetScape (I prefer Lynx).If only programmes would give a more usable
keyboard interface like XV does.The ability to use a windows manager of
my own choosing is nice.Though shared-VGA is still the way to go for
anything that needs performance.

And when you used the ST,didn't you use programmes that used video
memory directly or GEMDOS/BIOS in preference to programmes that used the
AES (Windows) to display text (or whatever).I tried to write a term
programme under BASIC once.But every time it sent a character to the

screen (window) the scroll bars got re-updated so it was incredibly slow.I ended up using the BIOS for screen display.
(oddly enough,the BIOS is what interprets VT52 codes so it worked out for calling ST boards,though it was really just a theoretical experiment)
It's amazing how fast BIOS text is (like when you use PCOMMAND or some other command line interface) considering it has to move around 32k of RAM.

That game looks like it was written by the same guy that did Xagon!
Same character set and style of graphics.Xagon was always one of my
favourites.But putting up a JPEG in a Atari news-group is kind of
pointless.And screen shots should really be GIFs anyway.
Too bad there's no GIF-to-GED converter.I'll have to convert it to a
(non-dithered) GIF and see what it looks like under 160x200x64 with
JVIEW (ColourView) some time.
(I really DO have to much spare time)

I checked out your home directory/file/page/whatever while looking at
the screen shot.Some [ahem] "interesting" pictures of yourself you have
there.

>
> I suppose I should break down and write it myself, but I'm not sure I
> have time to do so.

You could just use the built-in smooth scrolling effect of the XL/XE OS.

```
7 DIM Q$(40)
REM ALLOCATE MEMEORY FOR A SINGLE CREDIT
8 TRAP 100
REM TRAP ERRORS
10 POKE 709,14
REM MAKE BRIGHT WHITE TEXT
20 POKE 710,0
REM MAKE BLACK BACKGROUND
30 POKE 622,255
REM SIGNAL THE OS THAT IT'S SMOOTH SCROLLING TIME
40 GRAPHICS 0
REM MAKE IT SO!
50 OPEN #3,4,0,"D:CREDITS.TXT"
REM OPEN THE FILE WITH THE CREDITS.
60 INPUT#3;Q$
REM GRAB A LINE
70 PRINT Q$
REM PRINT IT TO THE SCREEN
80 INPUT Q$
REM DUMMY INPUT;PRESS RETURN TO SHOW NEXT LINE
90 GOTO 60
REM SECOND VERSE,SAME AS THE FIRST (THAT IS,DO IT AGAIN)
100 END
```

Just capture that to "CREDITS.LST".To load it into BASIC type
ENTER"D:CREDITS.LST".You might want to replace line 100 with a real
error handler.Put a clear-screen code (type ESC-CLEAR) at the beginning
of some lines to clear the screen if you're not going to have scrolling
credits.You can put arrows into those lines too if you don't want text
starting at the very top of the screen.Of course if you're not going to
use scrolling credits then you'll want the credits to appear instantly
which would require switching video memory locations.("double
buffering")

I'm not sure how to do that in a OS friendly manner.
(we're relying on the screen handler to do everything so that's
important)
And you'll probably want different sized text (GR.1 and GR.2).

You might look into a cable-TV buletin board programme that's used to
display text continously on a cable channel.I have one that I got from a
unknown source.

4836. Re: Atari Light Pen ????

Larry,

I picked up a few light pens at the Chicago show also and had similar
troubles. I think the stuff Atari brought with them was a reject batch
from the warehouse. There were quite a few defectives in the lot. The
cable for the light pens wasn't very pliable. Maybe that was the
problem?

Did you get any "power without the price" license plate holders?

Sure, Atari 8-bit versions of Asteroids and Ms. Pac-Man are good fun, but they aren't technically good; for example, the animation in Ms. Pac-Man is not very smooth and you get flickering ghosts!
Even in 1983, you could do a lot better than that; compared to other programs, Ms. Pac-Man probably isn't the hardest game to code...
True, it seems the C64 has better, more advanced sprite-handling overall.
Karateka is a loser on the 7800, but it has nothing to do with less or more RAM; the game is just a pain to play!
Anyway, you can put everything on a bank-select cartridge...

Well, I have the following
Atari 130XE (3), 800XL (2), 800 (2), 600XL, 1200XL, XEGS (1 and a 1/2 :-)
Lacking keyboard for one), 400, ST, STe 4Mb, Falcon 030 4Mb, Mega ST 2,
2600 (2 4 switch models and a Jr.), 5200 (2 of each 2 and 4 port), 7800
(2), Jaguar (3) with 2 CD units, Lynx (2), Lynx II (2)
TI-99/4A
Sega Master System II
Super Nintendo
Nintendo 8-bit
Intellivision (waiting for it anyway), same with Colecovision, C-64,
possibly a Vic-20, Vectrex, Philips G-7000

But none beat the feeling of the Atari's. Take Atarian care everybody

Text scroller programs appeared in magazines years ago and it should be possible to write something in BASIC. A good commercial program was Video Title Shop from DataSoft. Vendors might still have it. Check the Atari FAQ vendor's list at:

http://www.faqs.org/faqs/atari-8-bit/faq/

for addresses and phone numbers.

Do you recall the article name? Or have a URL if it's on the net?
(wishful thinking, I know)

I took the systems out last night and can give a better
description of the problems.

1) won;t power on. dead. no lights, no camera....

2) powers up, acts as if it would like to boot, maybe
even reads in a few sectors, then starts that sound
as if there were no disk in the drive. the one that
sounds like an injured burro. then silence. then
it no doubt times out to the computer, but the disk
may reawaken.

>>Could anybody post one that works?...

I have had the best success with C. Marslett's "UTIL.EXE".
I likewise had problems until I used an XF551 drive to format
the disks. Not even a modified 1050 would work properly. Why?
I believe the problem is that Atari drives other than the XF551
don't use the timing hole, so as a result sectors written on 1050's
(MFM D/D) can be written at the timing hole area. When an IBM
drive tries to read those sectors, it chokes. I can't remember if
I tried formatting disks on the PC or not, but I would sure think
that would work also (256K sectors, naturally.)

I picked up my somwhere in 87-88. I was a long time commodore user and picked up a 1200 from a another C= friend of mine who got it from some old man trying to sell it ass a c-128 in an add ;-). So i bought in return for $25. In the box with a basic cart, ended up buying dig dug a few years later. Just recently I got rid of a 1040St system for disk drives and goodies for the atari, good trades, I never could stand the ST gui being a mac freak for years (no flames please).

Now I can play all those games I would play at my friends house. Damn those were good. 1982-1984 was a good software year on that machine. Ohyeah, I can save my programs now and do assembler. Love 6502 code on the 1200.

Out of a closet full of 65XX machines the 1200 is my fave, If i had drives for it 10 years ago my 64 would have been a dust collector.

4862. Norwegian Atari 8-bit Users

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-21 00:00:00 UTC
From: Christian Fowler <nospam-cfsoft@mailcity.com>
Message-ID: <01bd84a9$2d160840$49dbccc3@default>
Source record: 62771

I have a question for Norwegian 8-bit users (if there are any on this
board):
I plan to purchase a 130XE via mail from the US. Have any of you ordered
hardware from overseas and had to pay customs? I know the Norwegian customs
can be a pain in the ***.
Thanks.

Christian Fowler

XDelusion,
The 1200 you are talking about sounds like an Amiga 1200 as opposed to
an Atari 1200XL. This this correct?

Besides the 800 and 2 130XE's, we've got a Sega Genesis w/ 32X expansion, and something else that I
doubt anybody ever remembers: The Adversary. It's a pong-like system that had tennis, squash, and
hockey built into one machine. Bit-block graphics (if you can call them that) and 2 controllers that
only went up and down. Still, it was some of the most fun we ever had sitting in front of a TV in
the '70s. There was no 1-player mode that I can remember (except maybe for squash) so this was
definitely a head-to-head machine.

Later!
Steven

Cool!!! It sounds like what you have is the modified ROM that Atari (and other software companies)
used to write copyprotected software, which would make sense that it was "an Atari in house setup."
Chances are you have a pretty rare jewel.

Anybody out there have any more info on the "E" ROM?

Steven

I have ordered a lot from the states and it depends on the price you pay. I usually don't have to pay customs with values below $50, but above $100 I usually have to. Where do you live in Norway ? I live in Sarpsborg, about 90 km outside Oslo. Take Atarian care

800XL
NES
Gameboy
SNES
Genesis
Saturn
might get an SMS soon

only Atari stuff I got is the 800XL, didn't buy video games
in early 80's because my 800XL is the same age as I am.

Thanks. I once had to pay customs for a walkman from the States, while I
didn't have to pay customs for an SMM80 printer for the ST!
I live in Oslo. Great to see there are still a few Norwegian atarians out
there.

I don't have an XL/XE.
I use my original CTIA 800.
I wasn't aware of any changes related to scrolling in the XL/XE OS.

i have a vast collection of other computers/game systems, they include:

colecovision
coleco adam
gameboy
atari 2600 (woodgrain and 4 button version)
original nintendo
atari XE
ti99/4a
atari 520 (520 stfm, 520st)
amiga 500
amiga 1000
vic 20
c 64
pet
coco I
coco II
trs80 I
atari 400
atari 130xe
apple IIe
timex 1000
sinclair zx81
pcjr
trs80 III

odessey II

Although I dont use these machines every day, they are all functional and they all have their own strengths and weeknesses for games (I am very partial to the atari 400, my favorite machine)

Hi there,

Just wondering whats the beans with "Glenn the 5200 Man"??

I remember this name on a few games I had back in the 80s
And have seen it more on a few on a CD of 8-bit stuff I've got.

AFAIK he worked at Atari. He was pretty clued up with game programming and 'tweaked' 5200 games so they'd run on 8-bit comps. And circulated them because they were good, and would never have been otherwise? These are all 'guesses'

What's the real story?
What is he doing now?

Just curious, as it has all the hallmarks of a true gamer-guy, fighting against the corporate crap. As far as I'm concerned he's pretty cool ! A lot of these games rock, and without him and YogiI wouldn't have seen many cool games over here in New Zealand.

Many thanks,

Cheers

John E Cash

Obviously... TI-99/4A (and Geneve 9640) and Atari ST (2.5M STfm).

But I am not interested in collecting. I want to support the old
systems, and I have little enough time to really support my beloved
TI, much less the more useful ST or newer A800.

I have seen some 5200 games, and they are subtley better. QIX
comes to mind as one with some maybe more improvement than
some others.

On the other hand, I've heard that the 7800 games were much better, especially
if there had to be a fairly large number of
moving, multicolored objects. Does anyone know what the
essential hardware differences were/are? In the computers,
it's Antic/GTIA (or CTIA), what's in the 7800?

Glenn the 5200 man rocks!

I have no idea who he is or what his name is but we owe him a lot for
bringing us some great games we would have never seen otherwise.

Do you have any knowledge that he worked at Atari? I've never
considered this before but it does make sense.

Wish we could find him.

Clean the edge connector, and if that doesn't work, start replacing 74LS chips on the board.

The orange (or black) carts use 2 ROMs, and the banks are in a different order. It is possible with a little hacking to read the code from the 27128 ROM in the BXE cart and re-order the banks. You *can't* simply split the code in the middle, also, you can't take a 2 ROM cart and read the code from the 2 chips, and burn it into a 27128 without editing the bank order.

I'll look @ my docs and try to find more info. I remember there are some bytes in each bank that identify it, and they need to be changed.

Since the stress of the inital current surge (and temprature change) when a device is powered on usually causes failure, I would expect that leaving it running would be better if it is frequently used.

Clean power and good ventilation will address most of the issues related to leaving it on all the time. But given the long term quality of power you get from a wall socket, clean power might be asking for a miracle :)

If its only used once a year or something, thats another matter.

>LWhite6497@aol.com

From what I remember (this is really going back now 15 years), the orange carts were Basic XL and consisted of two eproms. When ICD started selling/distributing the Basic XL/XE they were both released with only one eprom in the cartridge (black/yellow cart) and you could switch the eprom between the two so you could use a Basic XE to run Basic XL (don't ask me how I know).

But, going from Basic XL/XE Black/Yellow to the Basic XL Orange wasn't possible.

>>because they were good, and would never have been otherwise? These are all
>>'guesses'
>>
>>What's the real story?
>>What is he doing now?
>>

Actually, Glenn was a programmer for the government in the 80's and
the stuff was supplied to him by people who worked at atari or their
kids (many of the 5200 games were proto'd out to employee's kids to
play, and they passed it on.)

Glenn actually cracked a lot more stuff than people know - he just
didn't put his name on them. He put it on Alternate Reality because
it was the toughest protection he'd seen. He also cracked Alley Cat,
another tough crack (to file). He also figured out how to run
Impossible! cracks (hardware board that recorded an audit trail of the
sio commands and responses and made an index file so that you could
load an uprotected copy in, the impossible would supply the right
responses. Similar, in a way, to the Happy Tracker program that let
you store more than one protected boot disk on only one disk, but in
the happy's case the protection was still intact. The Impossible!
actually made unprotected boot disks.)

Glenn figured out how to get the impossible bios to run in Ram,
although it could get overwritten.

No idea what he's up to now, but he was really proud of the 5200->8
bit converts, thats why he puts the splashes in all of them. Since
I've not seen any other 5200 games that weren't done by him, I would
assume that it was really difficult. I did try to do it for 5200
baseball until I realized that the carts dont fit in the 8 bit slot,
you have to actually unsolder the chips and insert them into like a
basic cart or something. Thats why he was able to do it with the
protos since they werent soldered.

Also, he did the successful crack of Pitfall 2; the one that Steve and
Bruce distributed to all the so-called "shit-pirates" (their term)
when you jumped for the balloon the game crashed. They kept the good

one for themselves and a select few.

Owning an Atari 8-bit was a very frustrating experience, since although the machine was superior to the competition in most areas, the vast majoity of the games available were no better than other formats, and in a large number of cases *much* poorer. The impression that the companies thought Atari8 owners were so desparate they would accept any old stuff refuses to go away.

>> Atari 8-bit versions of Asteroids, Ms. Pac-Man or even Food Fight aren't good

Eh?! Don't know about Ms Pac-Man, but the Atari 8 bit version of Asteroids is *nothing* like the arcade game. Not very faithful at all. I've played versions on the Amiga and the BBC-B that were much closer to the original (which is a brilliant arcade game, even though it was already 8 years old when I first played it....)

How the heck can you even say that??
ever seen bad apple games??
bad c-64 games??

There are a TON of em!! every computer system known to man has had LOTS of
real looser games.. and way back then you didn't have all the companies with
mega budget games either!! Yeah there were a few, but LOTS of games were
written back then by some guy in his living room or den!

Montezuma's revenge was written by a kid,
Miner 2049er was written by a nobody,
heck I even worked with a company that put out
a three little pigs game for kids, and sub hunt and galaxy defender (a space
zap clone)

Synapse's stuff REALLY kicked major booty, and the games on the 8 bit were
MUCH better then the apple stuff of the same time..

Yeah the amiga stuff was really good, but that was a second generation of
computers, and much later then the haydays of the atari 800

Ya need to compare apples with apples..

Since there are no moving parts(that I know of, besides the keyboard of course) in the 800 XL, I'd leave it on all the time. I think the disk drive has moving parts. Eventually, the motor will die on the thing. If you're worried about unclean power spiking the equipment, you could buy a battery backup which smoothes the power as well as supplying backup power.

In my view the Atari 5200 was a huge stupid mistake. They could have produced a keyboard-less 400 and called it the Atari 200. The advantage would have been a large variety of pre-existing carts.

The 7800 has better graphics than the 8bit line, however the sprites are still one-color. I have a 7800, and it seems to me there is a potential for more advanced programming than the 8bit line could have handled. However this potential was rarely realized and there is only a small library of software for the 7800.

Good Guess!! yes I did! I did the graphics for the magic storybook, and also galaxy defender.. (I play tested that till I was BLUE in the face.. it had to be addictive!!)

Interesting side note: the programmer who did storybook is now in jail for molesting his own daughters.. odd how some people end up..

There's also a antic disk that was sold of "heavy metal" graphics (they sold my stuff without permission, but did finally apologize, and send me a nice little check) I'm also responsible for a risgue' smurf animation.. ;)

In my amiga years, I setup the cleveland insttute of art with amigas, and trained them on Dpaint, and I now work for Disney, and used amigas in the spectromagic parade at Magic Kingdom..

I also did quite a few complations of basic games, with enhancements, like a super motor cycle maze rider (that facinated me for some reason) and some antice platform games.. Oh and I'm also the guy that compiled computes' gold digger type game (my version has purple dirt.. go figger!)

so I'm part of the old atari legacy... BTW you should heard the rock version of the soundtrack of magic storybook that didn't make the release.. it was GREAT!!

Some good stuff was still coming out in the UK after this (Zybex, Draconus), I think because the 8-bit market there generally lasted longer (lower disposable income, higher prices?). Budget software (£1.99- £2.99) in the UK (almost always on tape) was a huge market, and a lot of it, although not radically innovative was brilliant for the price. I have fond memories of a lot of these games (although some of them were reissues, or just plain crap). Most of the Americans posting to this group seem to be getting nostalgia about the early 80s, but I didn't get my 800XL 'til late '86, which probably colours my views.

>1. It survived into the era of Nintendo-style games, so there was an
>infusion of different ideas and play styles. (I'm not a fan of early NES
>games, but the new blood sparked creativity.)

Like I say, the 8-bit market in general survived later in the UK. Companies like Zeppelin who supported the Atari8 dropped their support around '91/'92, which sounds bad, but it was at this point that most commercial support for its rivals (Spectrum, C64) was cut off too. Funny that, I'd have thought that the smaller Atari market would have dropped below critical mass some time before the competition, but it lasted about the same amount of time (albeit with the usual smaller number of releases).

>3. The average technical competence of C64 programmers was eventually much
>higher than that of Atari programmers.

Or maybe a lot of "Atari" programmers were, say C64 programmers, who also knew enough about the Atari8 to do a conversion, without being that great at it...

What put me off the Atari8 at the end of the day was that it was all nostalgia, I'd seen it all before (that's not to say I couldn't have learned a lot more about programming the machine, but there was no point, since it was all history). Nothing new was being done, the games market was stagnant. Okay, some new stuff was coming out, but it was no better than stuff circa '83-'84.

But it still p****s me off that I can't connect a light sensitive resistor to the "joystick" port of my PC, and write a program to print of the value "just like that". I turned my 1020 plotter into a scanner in this way, and it actually worked (after a fashion). I'm typing this on a Pentium 233 based PC, and there's no way I could do that on this machine without becoming a *hell* of a lot better at C/ C++, and learning more about the workings of the machine. Sometimes power is just an illusion....

Oh well, I guess I could write more, but I've always been too long-winded in print, so I guess I'll shut up now. ;-)

>>owners were so desparate they would accept any old stuff refuses to go
>away.

>How the heck can you even say that?? ever seen bad apple games?? bad c-64
games??

I'm sure they're crap, but you're missing the point. In *GENERAL* the Atari
was technically better, but the games released didn't do justice to the
machine, partcularly once the C64 was established. From the mid 80s onwards,
Atari conversions were no better, and usually slightly inferior to the other
versions for one simple reason- lack of effort. Perhaps there weren't enough
programmers who knew the machine inside out to do it justice. Perhaps it was
just that the companies didn't want to squander resources on a relatively
small seller.

>every computer system known to man has had LOTS of real looser games..
>Synapse's stuff REALLY kicked major booty, and the games on the 8 bit were
>MUCH better then the apple stuff of the same time..

The Apple wasn't the competition, the C64 was. And in the UK, the Sinclair
Spectrum was the biggest selling machine by far. I agree with you on Synapse
though, great for the time.
And although it's not personally my favourite game, Star Raiders was an
absolutely *amazing* achievement for 1979. *1979* fer chrissakes!!!! It was
five years ahead of its time, brilliant considering how different the market
was between 1979 and, say 1984. 8K ROM? ******* genius mate!

>Yeah the amiga stuff was really good, but that was a second generation of
>computers, and much later then the haydays of the atari 800
>Ya need to compare apples with apples..

Who mentioned Apples? I didn't. My period of Atari fandom was a lot later
than most of the users in this group, '86 onwards, but the 16-bits didn't
really take over in the UK until about '89.

My point is this. From the launch of the C64 onwards, the Atari8 was
gradually relegated to second place. Games came out on the Atari less often,
and a lot longer after the "mainstream" releases, and didn't seem to have as

much effort spent on them.
I also reckon, personally, that another reason conversions weren't always as good as they should have been was that they didn't take into account the particular strengths and peculiarities of the Atari8. The best Atari8 games were usually written for that machine in the first place, since they were designed around the hardware.

One of the largest causes of failure in modern hard drives is supposedly when businesses leave them switched on all the time, the drives heat up, and some of the lubricants evaporate. Then there's a long (say, bank holiday or whatever) weekend. They switch off the computers, the drives cool down, and all the lubricants condense on the disc surface. Tuesday morning, everyone comes back and the drives are knackered.
Take a brillo pad to 'em, that's what I say!

Nah, OSS was using the black & yellow carts before ICD ever took over.
I bought my BasicXL and Action! before ICD took over and they are
black & yellow. My Mac/65 cart is the orange type, which I bought
used from a friend who had gotten it for his 800 back when the Atari8
was younger.

We should also wholeheartedly thank the Poles for bringing us excellent stuff. There are some real gems out there and some programs are big games (something we thought we'd never see again...) with super playability and brilliant coding.
These guys are REAL Atari programmers and should be idolized!

About C64 ---> Atari conversions: if it's "simple" 6502 programming, it's not "incredibly hard" (I just mean it can be done, one way or another) to transfer code and some games are 99% identical on both platforms (Astro Chase, Superman...); even some of the newer Polish games are partly ripped (some of the monsters from Wloczykij come from the C64 game Creatures, Operation Blood uses the C64 sprites and background of Operation Wolf, Operation Blood II - Special Forces is almost exactly Operation Hanoi on the Commodore...).

4913. Turbo Basic MOVE command

From: Dwayne <nospam@junkmail.com>
Message-ID: <35678fca.0@news.webnology.com>
Source record: 62680

Does anyone still have the original artwork for M.U.L.E.? I threw my old E/A cover away years ago, and would love to have it for wallpaper. If someone still has it, could they e-mail me a scan? preferably 800x600 16bit color, in jpeg format (jpg)

I hope someone remembers this picture. It was on the old E/A box (like a big cardboard CD cover of today...) and had a picture of a MULE loaded down with stuff. (if i remember correctly.)

BTW, also which .atr/.xfd works with the wampus correctly? mule.atr crashes when you catch the wampus, mule2.xfd does not let you catch it at all.

Thanks in advance!

> HD type no Good

Hi-
I'm sorry that I can't help you directly, but perhaps I can point you
to a site that can. I also have a question. Why won't a HD (1.44)
drive work for you. I've never seen one that won't write 720K.
Likewise, can a 720K drive actually write in SD? I didn't think
that was possible?

>double/single Density Floppy Drive

Now the help. Try http://www.hi-tech-reno.com They are
sellers of used/refurbished/new drives. They have lots of stuff,
and I have seen 720K drives there real cheap.

Regards,
Larry White

Anmerkung: Dieses ist eine Doppel-Spracheintragung. Erstes Englisch, gefolgt von German.

Ever wish that you could read all of those German language web pages that pertain to the Atari 8-bit? I know that I sure have! There is a free translation service called the AltaVista Translation Service (AKA Babelfish) on the web. It's URL is-

http://babelfish.altavista.digital.com/

Although the translation isn't perfect, it is sufficient to understand most of the details. As a test, try the first link below to view the page in German, then try the second link to view it in it's English translation. The URL is long so the text may wrap, so you might have to copy and paste it in sections.

German- http://privat.schlund.de/toro/abbuc.news/

English- http://babelfish.altavista.digital.com/cgi-bin/translate?urltext=http://privat.schlund.de/toro/abbuc.news/&languagepair=de_en&doit=done

This opens up to English-only Atarians all of those web pages that are not only in German, but French and a few other languages. Another great set of German Atari 8-bit pages are found at the link below. This is the Atari 8-bit Resort page that contains links to all of those great German ABBUC newsletters. Just click on the link, scroll down and select an ABBUC newsletter, then click on TRANSLATE. The URL is long so the text may wrap, so you might have to copy and paste it in sections.

http://babelfish.altavista.digital.com/cgi-bin/translate?urltext=http://www.uni-karlsruhe.de/~Marek.Tomczyk/8bit.html&languagepair=de_en&doit=done

You can even use babelfish to translate not just web pages, but anything you can type into it! The example below is an English->German translation of this message-

======== My Poor German ========

Auf Deutsch:
W�nschen Sie �berhaupt, da� Sie alle jene deutschen Sprachweb-Seiten lesen konnten, die das 8-bit Atari betreffen? Ich wei�, da� sicheres I haben! Es gibt einen freien �bersetzungsdienst, der den AltaVista-�bersetzungsdienst (AKA Babelfish) genannt am Web. Es ist URL ist

http://babelfish.altavista.digital.com/

Obgleich die ?bersetzung nicht vollkommen ist, ist es gen?gend, die meisten Details zu verstehen. Als Test versuchen Sie das erste Link unten, um die Seite auf Deutsch anzusehen, versuchen dann das zweite Link, um es in ihm anzusehen ist englische ?bersetzung. Das URL ist lang, also kann der Text aufwickeln, also konnten Sie ihn in den Kapiteln kopieren und kleben m?ssen.

German- http://privat.schlund.de/toro/abbuc.news/
English- http://babelfish.altavista.digital.com/cgi-bin/translate?urltext=http://privat.schlund.de/toro/abbuc.news/&languagepair=de_en&doit=done

Obgleich die ?bersetzung nicht vollkommen ist, ist es zu diesem erschlie?t zu Atarians gen?gend, das nur Englisch alle jener Web-Seiten, die nicht nur auf Deutsch sind, aber der Franzosen und einiger anderer Sprachen verstehen. Ein anderes gro?es Set deutsche 8-bit Seiten Atari gefunden am Link unten. Dieses ist die 8-bit R?cksortierungseite Atari, die Links zu allen jene gro?en Rundschreiben des Deutschen ABBUC enth?lt. Gerade klicken Sie an das Link, scroll unten und ausw?hlen Sie ein ABBUC-Rundschreiben, klicken dann ?BERSETZEN an en. Das URL ist lang, also kann der Text aufwickeln, also konnten Sie ihn in den Kapiteln kopieren und kleben m?ssen.

http://babelfish.altavista.digital.com/cgi-bin/translate?urltext=http://www.uni-karlsruhe.de/~Marek.Tomczyk/8bit.html&languagepair=de_en&doit=done

Obgleich die ?bersetzung nicht vollkommen ist, ist es zu Ihnen kann babelfish sogar benutzen, um nicht gerade Web-Seiten zu ?bersetzen gen?gend, aber alles, das Sie in es schreiben k?nnen!

Yes, I have a number of Percom SD/DS disk drives fitted with 720k 3.5" drives
that can only deliver 360k because they are single density.

>* Atari 400/800 emulator for the PC (Pentium)
>* The game star raiders (compatible with the emulator above)

Yep! I just got this recently, but I'm not going to clog up the group by posting it there!
You need a program called Win800 (I can send this to you, or you could always FTP it), plus the ROMS (not to be distributed with the emulator!). There are other emulators available, but this one works pretty well.

The game is at ftp://ftp.hackerz.com/atari

I'm not sure about all this emulator stuff, and reminiscing in general. Some of the games are fun, others look even worse than their age on that pin-sharp PC screen. It's all a bit dead end - or is it? (If you're going to emulate, at least emulate the best! ;-))

Source record: 62599

Looking for a home for my Atari 800XL system, complete with disk drive, printer, monitor, cartridges, SW and manuals.

The computer, disk drive and printer are in excellent condition and are all working. I have not used the cartridges and programs for some time, but I did a quick check and all appear OK. The other accessories have not been checked, but I believe they are also OK. Most items are complete with their instructions or manuals.

The system is located in the Northern Virginia area (outside Washington DC)and may be inspected prior to sale. I prefer to sell the entire system along with the cartridges and software in one lot, but all reasonable offers will be considered.

e-mail: crossnet@ix.netcom.com

I don't think so. I'm using Atari800win, which is a near-perfect
emulator. A bit more tweaking and I can probably throw away my
decrepit hardware for good. Amusingly, it takes a pentium to replace
that hardware, but then again my pentium isn't much more expensive
than what I originally paid for my 800 and peripherals.

I've archived all the old Atari software from the Hackerz site for
posterity, though I probably will never run 1% of it. But MULE and
Jumpman and a few others will get plenty of play for years to come, no
matter how antique they look.

>None computer question: Where can I get a atari logo t-shirt

I don't think they're sold anywhere anymore. You could get one copied on
a T-Shirt yourself though. Lots of copycenters (like Kinko's) can make
copies on T-shirts, mousepads, coffeemugs etc. (Gives me an idea, I still
don't have an Atari coffeemug).

The Atari emulators in the A800 group are damn near spot on now, where
my old 130XE with multi opsys board with OMNIMON used to get turned on
all the time its now gathering a bit of dust..

Now if only Rich can get that monitor added (Omnimon pref) :)

I'm sure this topic has been disussed several times on this newsgroup
before, but I'm quite new to this group.
I'm currently purchasing an upgraded 800XL from The States. I live in
Europe, and will have to modify the 800XL to PAL.
As far as I have understood, all I need to do is swap the NTSC Antic chip
with a PAL one from B&C.
I've also read that a minor change to the OS is needed.
Is there anything else I would need to do, and is the OS change really
necessary?

Thanks!
Christian Fowler

4958. Atari 2600 Waterworld proto and some C64 carts.

Message-ID: <1998052517085700.NAA27813@ladder01.news.aol.com>
Source record: 62621

Hi, just picked up some C64 carts, have no idea if they are collectable or anything?? They came with a batch of C64 games/utilities I got. Will probably be trading/selling a bunch of the stuff (the games/utilities are new and shrinkwrapped, the carts are just carts) I am looking for original Ultimas 1 and 2 for ANY computer platform (especailly the Atari 8-bit Ultima 1). Will trade multiple games for the Ultimas I need. Also have an Atari 2600 Waterworld proto (Best Electronics version, it is NOT a burn-in). These are the carts:

Galaxian Atarisoft
Ducks Ahoy CBS
Peanut Butter Panic CBS
Sea Speller Fisher Price
Visible Solar System Commodore
Wizard of Wor Commodore
Up and Add'em FP
Memory Manor FP
Logic Levels FP
Big Bird's Special Delivery CBS
Delta Drawing Spinnaker
Ernie's Magic Shapes CBS
Alpha Build FP
Fraction Fever Spinnaker
Dig Dug Atari
Frogger Parker bros.
Kid's on Keys Spinnaker
Donkey Kong Atari
Alphabet Zoo Spinnaker
Number Tumblers FP

There are about 300 new C64 titles, most are available for trade.

Thanks,
Tom

4959. My 810 was working perfectly, until...

Message-ID: <01bd8802$f467d700$60128ea7@login.netins.net>
Source record: 62622

Yesterday it was working flawlessly. Today, when I tried to boot to my usual DOS 2.0 diskette, the drive made a EUNHH EUNHH sound. I tried a couple more diskettes, and some others that should have worked did not. I booted to yet another one and it booted into DOS. When I try to read certain disks, it gives the effect that some are worse than others, but the particular diskettes that didn't work make me think that I've had some kind of drive problem instead. It will write DOS to another diskette and then read it with no problem, so I wonder if I have a head alignment problem. Can anyone shed some light on this? Or has anyone had a similar problem?

Well, one of 2 things most likely. (Assume it's unmodified 810) Head alignment is possibility as is speed. Many of the 810's drift over time to a speed that causes diskettes not to read. Either case, if you format a disk, and put DOS and/ or other things on it, it should work fine with THAT disk. Consider, you will have written it witand are reading it with the same problem in both cases. If, OTOH, it is intermittent also, then look for electronics type failure. A lot of times the 1771 formatter got "intermittent" on thos drives. Also, most of those drives had and MPI mechanism, but some had a , oh heck, I can't remember the name of the company now, but, if the 'door' is full size and flips up, it is an MPI. Head alignment on each of the 2 drive types is different. Also, the speed pot was located slightly different spot. Good luck. Terry K

Hi there,

There are Atari logo shirts NEW available from Atari Computing.
IIRC they are black T's with a white or gold (hard to tell in a B&W mag!!)
With the Fuji logo, and ATARI written underneath.
Marketed as the ultimate in 80's flashback !!!

I had a look at their web site and couldn't see the details there, but there
is definitely an ad for them in the mags.

I will hunt one out from home tonight, and post up the details tomorrow,
unless someone else has them on hand with the info.

Cheers,

John E Cash

>registers that were missing from the list maybe?

GTIA doesn't have sprites. It has Player/Missile Graphics. With PMG,
you can't shift the vertical position with a register the same way you
do horizontal position. Instead, you either have to copy the data or
change the register that says where in memory the PMG resides. The
latter is simpler, but requires more memory (as you have to allocate
extra zero space).

Source record: 62633

Hello,
Would anyone be interested in a different form of the SIO2PC cable?
I was thinking of laying out a card that would have the required
electronics and support an SIO connector and an RS232 connector, so
everyone doesn't have to cut up their cables, just plug them in!

I was thinking of offering them in two forms, just the cards, (you buy
the parts and assemble) and assembled. Cards alone would be like $7-$8
and the assembled cards would be about $23-$25.

If anyone is interested, email me at tony@embeddedmicro.com, or come to
my site: www.embeddedmicro.com and leave me feedback.

thanks

4971. mouse questions

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-25 00:00:00 UTC
From: Dan Olson <dano@agora.rdrop.com>
Message-ID: <Pine.BSF.3.95.980525154949.5312D-100000@agora.rdrop.com>
Source record: 62634
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.atari.st

Hi,
I just bought a Commodore Business Machines mouse today, I had searched a little in comp.sys.cbm before trying it out and all I found was simply that an Amiga mouse was incompatable with other earilier Commodore machines. Sence there was no other information on this mouse other than a serial number, I decided to try it on my Vic-20, and as it turns out it simply works like the joystick, for example, moving the mouse up in a game is gives the same affect as moving the joystick up. I also tried an Accutrack track-ball I got and found it did the same. I got to wondering if there was something special in the Commodore doing this, or if the mouse truly looked like a joystick to the computer, so I tried both on my Atari 600XL and then my Atari 2600, with the exact same results. I know that the Atari 1040 ST we used to have had a mouse that used the joystick port as well, but for some reason I thought it sent it's data through the two pins used for the paddle controllers, do the Atari mice work the same way as this Commodore mouse does? I thought I had read that Commodores used a different mouse convention, were there other types of Commodore mice for their 8 bit machines as well? I'm just wondering if what I have is something weird that's supposed to be used just for joystick-based software, of if the same interface is used on other Atari/Commodore mice. By the way, the mouse works great on games where you move something around the screen, I tested it on the 600XL using Centipede, and it worked very smoothly, much better than the joystick even. Please e-mail me a copy of any replys. Thanks.

Dan

MY memory of programming the machine tells me that you had a single strip
"sprite" down the screen, and by modifying the memory page that it was
pointing to, you effected vertical movement. That is, you shifted the
graphics in memory, and it shifted on the screen.
I'm STILL looking for a copy of "Qb" - see
http://www.comcen.com.au/~adavie/qb2.jpg
Cheers

Probably of no use to you but Virgin record shops in the UK currently sell a dark blue T-shirt with a big silver Fuji on it (and oddly, a (c)1997Atari (or thereabouts). Looks like it's aimed at the clubber more than Atari fans.

Also, Sigue-Sigue-Sputnik seem about to relaunch themselves and they were always very fond of Atari logos over everything so that may produce more stuff.

(Still got a rather tatty "Atari Baby" T-shirt somewhere!)

Here's some apples to apples then:

Compare Atari Dig Dug to C64 Dig Dug. Both written by Atari

Compare Atari Pole Position to C64 Pole Position

Compare Congo Bongo to C64 Congo Bongo

Compare most of the latter Electronic Arts stuff for the Atari to any other platform.

Synapse was the only company I remember making the effort to produce excellent Atari ports.

Hi Again... well, the name of the mech. I couldn't think of is TANDON. That 810 has jost a tiny 'door' in the middle of the slot. Matter of fact, I just worked on one a few minutes ago. Doing the same thing as yours. Grinding noise, over and over as it tried to seek. This drive needed a head alignment. Fairly easy to determine. Take cover off. Put a disk in and watch it. 1st, before you put a disk on and before you turn on the Atati, with the top off the drive, watch the heads. On power up, the head should move back to rear stop, the spindle should be turning. After a few sweconds, maybe 15-15, the head should move to the inner limit (toward front) of drive. It should stop there, and the spindle should stop turning. If it does this, you can eliminate a lot of elotronics. Now, insert diskette, turn on Atari, and watch the drive. Heads shpuld move back to the rear again, spindle turns, and it should start reading the outer track. If at this point, you don't hear the normal, beep beep beep etc. as a normal load, and before it starts the head 'burping' again, GENTLY, put a little backward pressure on the head. In other words, try to push it slightly toward the back. If it starts a normal read, the head is out of alignment. If that doesn't work, try pushing the head from behind it, toward the front. Either way, if it starts a normal read, but stops after you release pressure, the hea needs alignment. If it's a Tandon, you'll see a little motor on the right side, that turns the shaft the head is connected to. The head is attached via a 'set screw' with a hex key head. Turn the drive off. Manually move the head until you can get to the screw to loosen it. Depending on which way you moved the head to get it to read, move the head anthe shaft, which is now loose, a little bit. Tighten the screw, and try it all again. It's a kind of hit or miss deal, but, after 2 or 3 tries you'll get it. Make sure to tighten the set screw fully, or head will misalign again. Now, mine also needed a slight speed adjust. It was running at 285rpm. Should be at 288rpm. At back of drive, on the back board is a small 'pot' with a tiny slot. That is the speed adjust pot. You'll need a Dos that allows you to check speed. I use DOS 2.6f, which has a 'Speed' selection on the menu. Any problems, leave me email. I'll see if I can help. Took about 1/2 hour to get this drive going. That's from top off to top on. Terry K

Actually I think the C64 version of Pole Position stinks. The controls are
far better on the Atari, although the sprites looks a bit blocky. But,
gameplay rules on the Atari.

The earlier Electronic Arts titles (Seven Cities Of Gold, Archon...) are better on the Atari; Rescue On Fractalus!, Ballblazer and Encounter! really rock on the Classic, as they are faster and more colorful.
Defender is ridiculous on the Commodore; C64 Robotron and Donkey Kong are not really exciting.
Other stinky C64 conversions include Pharaoh's Curse, Elektraglide, Joust, Galaxian...
On the other hand, C64 Ms. Pac-Man is really fantastic!
Generally, lots of more recent stuff is better on the C64...
My opinion: don't choose the Atari or the C64, take both!

I have a mule.atr which I downloaded in October 1996, don't remember
where. It works well with either XL-It! 0.20 or Atari800Win 1.9b2, no
crashes when I catch the wampus.

From the Atari computing Ad.....

CULT ATARI T-SHIRTS Thanks to the seventies revival, the Atari Logo is popular once again. We now have stock of new sexy and trendyAtari T-shoirts featuring the famous Atari Fuji Logo in silver relief. They're black, 100% , unisex and one size fits all.

8.99 pounds including P&P NOTE: (I think that might be UK only though to include P&P, AND this is a reader offer, so I don't know if they'd charge an extra pund if you were a non-subscriber or not, but if you go to their website at http://www.ataricomputing.com/ or email them at admin@ataricomputing.com, they should be able to answer this)

Judging from the picture the logo looks about 5-6 inches high, and ATARI written underneath about 1-2 inches high.

Cheques payable to Atari Computing
Address is 73 Bentwick Drive

Does anyone know anything about a game that (I think) was called Brumbles Super Spy.

I remember a company called Databyte advertising lots in the british magazine C&VG in the mid eighties. They were bringing in quality games for the Atari (from the states ?) and advertising them nicely (and they were on disk !) like BoulderDash, Spy Vs Spy and Montezuma's revenge, and I remember they had this one that looked abit like a cross between elevator Action and Mission impossible.

Just wondering if it really existed and what it was like??

(IIRC they also advertised a polar game (might've been Spy V Spy 3) and a caveman style one too, but their names elude me.)

Yeah, although there's a lot of good games for the 8-bits, I too agree that some of the conversions could've been better. You see some really good /|\ software, then you see a game on the Spectrum or C64 which you'd like (and it *should* be able to do) and the conversion ends up totally crappy. Very disheartening compared to the Speccy, (which did have lots of good games)

Cheers,

John E Cash

> MY memory of programming the machine tells me that you had a single strip
> "sprite" down the screen, and by modifying the memory page that it was
> pointing to, you effected vertical movement.

Didn't realise you could do it the "easy" way by modifying the base address, but if you can only move a page at a time surely this wouldn't work??

Anyway, the way I used to do it in BASIC was as follows.

Define a string and reset its start address to point to the start of PM data. Can't remember how you do it but it must be documented somewhere. Then any assignments you make to that string appear directly on the screen.

e.g. suppose you have a 16-byte shape, its data stored in SHAPE$. And the y-coordinate you want is stored in YPOS. So:

```
PMG$(PLAYERNBR*256+YPOS,PLAYERNBR*256+YPOS+15) = SHAPE$
```

this will put the shape onto the screen! If you define the shape as having a blank byte at either end you can move the shape up and down without leaving "trails" (or define 2 blank bytes if it can move 2 pixels at a time).

If the YPOS can alter randomly (e.g. in repsonse to paddle or Touch Tablet input) then clear out the area first:

```
PMG$(PLAYERNBR*256,PLAYERNBR*256+255) = BLANK$
```

where BLANK$ is a 256-byte string of CHR$(0).

Hello.
I've put up source code for working A8 code that will unzip most any pkunzip 1.xx zipfile. It will NOT unzip modern zipfiles, that use the deflate algorithm.
This group of files, ACTION! source, the ACTION! compiled .COM files (must have ACTION! cart to run), some test .zip files, and some documentation, are in a file called RGUZ98.ARC, in the IFYOUWILLBETAFORME directory. Just go to any directory, then go up one level.
Also included is the pascal and C source codes from S. H. Smith that I work from.
THIS IS A DEVELOPER'S KIT TO DEVELOP AN A8 ZIP/UNZIP, IF YOU PLEASE.
Probably not too many people interested. But, be my guest, and drop me a note about it if you get a chance.
russg@en.com
The files can be obtained from:

Work on getting the SuperVideo article ready to post to my webpage is
beginning to progress. I have run Xerox Textbridge OCR on the scans of
the ten pages of the article.

That still leaves quite a bit of work, with the next step being to
proofread the article and correct what the OCR omitted or simply got
wrong.

After that comes the task of putting the text in HTML form and
inserting the graphics sections.

At the rate I have been going, I should have it ready as a Christmas
present to the Atari community! <grin>

Sounds just like what I've done. Only hard part to get is the SIO male
socket. About $3.00 - $4.00 when you can find them new or free off old
junkers. Rest of the parts and box can be purchased from RS for $6 to
$7 so the whole thing runs under $12.00 and a little of your time.
I've knocked out over a dozen of these now. The 2 chip version runs
about $5.00 more but provides much better performance. Better yet,
just install the interface in the computer itself. Works great.

Later..

Perhaps, but some games like Star Raiders, Defender, Jumpman Jr. and Space Shuttle would never play
on it, since they also use the keyboard for different things.

The XE game system was the closest thing to your concept, and even it failed. Too little, too late,
I guess.

Not only that, but the emulators just don't seem to do the color artifacting right. Atari programmers learned to make the most out of a poor video system, and running emu's on pc's with
near-perfect monitors just makes games like LodeRunner look a little funny. Call me weird, but I
also miss the pixellation of the GR.0 text on the emu's.

Boot XL-It! without BASIC, then in DOS press the '2' key to prove that missle.exe is indeed in your
.atr file. If it's there, press 'L' for binary load, then type '2:missle.exe' (without the quotes
of course).

Another option is to use XL-It!'s ability to read directly off your hard drive as the Atari H:
drive. Then you can 'C' copy from H:missle.exe to 1:missle.exe (or any other loaded drive image).
Check the XL-It! docs to learn how to do this. It isn't as reliable as a program like Imageman.exe
(for PC DOS). I think you can find Imageman at the UMich archive if any of the above didn't help.

Good luck!

The original CTIA chip. Interesting side note -- I saw somewhere not too long ago that the GTIA
chip was actually finished BEFORE the CTIA chip, but it had a few bugs that needed to be worked out,
so Atari put the CTIA in the original 400 & 800 machines until the GTIA was fully ready.
Anybody else know more about that?

Oh, yeah, don't forget about the AMIGA chip. Don't let those Commodore fans fool you, AMIGA started
as an Atari design.

Steven

Why would someone want a bitmap font for DOS anymore? Isn't this thread
about a truetype font? That has nothing to do with EGA, VGA...not to
mention that those screen fonts can only be used for monitor display and
not for printing or assembling html pages.

From what I heard the guy who orinigally did Dig Dug had no clue how to write games on the 8bit. Others working in Atari we're surprised he was the sole programmer for the project. The 'Brown' label Dig Dug is a piece of trash. Slow, clumsy, lousy play. Dig Dug was redone, The Silver label version, into a more playable version but the graphics were still lousy.

I think since Atari had to release a 5200 version they applied the updates and re-released Dig Dug on the 800(which is identical to the Silver Label version).

Sounds like you have a C=1350 mouse. This was Commodore's original mouse, the "rolling joystick" as it is affectionately known. It sends standard joystick up, down, left, right, and fire signals (don't know how it does the right button). Commodore then came out with a true proportional mouse, the C=1351. This uses the POTX and POTY lines to feed an analog signal to the computer, and fire for the left button (I don't know about the right). These are the mice for the VIC/64/128 series. I believe there is a C=1352, but that's an Amiga rodent.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Howdy everyone! I wanted to see if anyone has had any luck hooking up your Atari to a network? Currently, I have my 800 connected to a 286 via a SIO2PC cable allowing me to use the 286's modem to dial-in to our campus unix box. Well, this summer I have moved into a nice new dorm (for those wonderful 7am summer school classes...*bleh*) that has network connections to the net (10baseT) in every room. <drool> Anyway, I got to thinking, wouldn't it be great if I could connect right up to the network and forget about my comserver connection (since it kicks me off every 90 minutes)...has anyone done this or is this just another pipe dream? :)

Steven,

You are right: the XE Game System is EXACTLY what would have taken off, had it come earlier. Atari had that technology from 1979 for pete's sake. And when did XEGS come out, 1985?

In between is the lame 5200 system which had ZERO significant advantage over the 8bit line.

Oh well, sometimes it's fun to play 'what if.' Still remember the /I\ signs from Bladerunner?

Ha ha! I have everyone beat, I'm sure.

I have my 576k XE (with dual 44mb removable Syquests via BB) connected via APE 1.17 to a Compaq ProLinea 486/66 that is 10mb Switched Ethernet connected to my home-based Novell Netware 4.11 network that has a dedicated 128mb ISDN router-based connection to my office network (which spans the country (USA), let alone full access to the Internet).

Whatever I access (map a drive to) from my 486, I get access to from my Atari, including laserjet printers, gigabytes of directory access, Internet ftp sites, etc..

uuuhhhh..... excuse me? Are you referring to the stiction problem being described? The fact that the heads weld themselves to the surface of the disk is certainly not crap. Many major disk manufacturers wish it were! The longer and hotter you run you drive, the more gunk that builds up on the surface of the head (not the platter - it has stuff all over it anyway). When you stop your drive and the head lands, the gunk will solidify into glue after a while. Add in a little moisture as the interior pressure is relieved thru the vent. At this point, you have two choices: apply a lot of torque and rip the head right off the flexure, or the motor won't even start up. One solution is to run the head out over the platter and wipe off the gunk at low speed - before the drive gets cold.
Not that the solution is to never spin down the drive.... I would suggest a weekly shutdown to prevent a gunk buildup - and keeping the drive cool. People that never shut off the system had better have a good UPS.

You've just said *exactly* what I'd been thinking recently about the Amiga (more so even, than the Atari-8). Once Doom came out on the PC, it was that machine setting the pace, not the Amiga. Eventually, versions of Doom came out on the Amiga, but only one ran on my 68000 based A500Plus. It was creditible, and given the limitations good, but...
What happened with both the Atari and Amiga was that small software houses did versions of games from bigger, faster machines. The second time round, with the Amiga, I recognised the symptoms better. When Escom re-released the Amiga 1200 circa late '95 for £100 more than it had cost over a year previously (when it was already looking a bit dated), and regardless of their excuses ("we had to pay the factories more to get them out quickly") it smacked of milking the fans dry. That was when I decided my next machine was a PC. It took 2 1/2 years for me to get round to buying one... !
Mind you, before W95 came out, PCs couldn't multitask much, and the interface sucked.
I still think the Amiga OS beat hell out of the PC until W95.
Still, this isn't an Amiga group.
Nor is it a Genesis/ Mega Drive (the UK/Asian name) group, but for what it's worth, I think that that machine ran sideways scrolling games very well (it was probably designed with them in mind- Sonic was technically brilliant), and other types of games ran less well. Lotus (a racing game) was vastly inferior to its Amiga counterpart, and the flight sim I saw was crap...
Unfortunately, I never liked sideways scrolling platform games, and since 99.9% of MegaDrive games were like that I was never a fan of the machine.

Now this is something I've wondered about for a long time... I used to have
two files of Dig Dug... one ran full-screen, in what looked like GR.7, and was
pretty hideous. The other ran narrow-screen, was higher-rez, and generally
much more playable.

May I safely assume the former file was the Brown-label version, and the
latter was the Silver-label version?

Speaking of complete rewrites, has anyone compared 5200 Mario Bros to
XEGS Mario Bros? I've got the "Glenned" port of the 5200 version, and always
meant to pick up a copy of the XEGS version, since it looked much more
authentic to the original.

From the old memory banks...

Only the old 400/800 would have the CTIA chip, it was later
replaced by the GTIA chip which added 3 or 4 more graphic modes

The 1200XL had the ability to use the RAM underneath the OS
and CART. but since nothing ever took advantage of this...
Also, you can use memory from $C000-$CFFF which was wasted
in the 400/800.

The XE and later had the same ability as the 1200 except the
big bank select RAM area ($4000-$7FFF) (i think) again unless
somethink used it...

The 7800 is actually nowhere near the 8-bit computer line, has
no pokey unless you put one on the cartridge board (BallBlaster).
The graphics are based on Display List List (DLL) so you have to
build each screen on the fly. May sound like alot but the advantage is
you can have alot of sprites on the screen. However, you have to do
your own collision detection, etc... The sound chip is the same as the
2600 so nothing great there but it made 2600 emulation easy.

I have Dimension X up and running on one of the better emulators for PC.
I saw the original one in '84 .
How was the grid ? I am not getting a REAL solid grid (the floor you are flying over).
I get some sort of streaking patterns.
Was it how it was in the original version ?
A bad crack ? a bad game image ? a not up to date emul ?

Walt

5018. Super Zaxxon - Working ATR

So Sigue Sigue Sputnik is coming back? Cool! I didn't know they put Atari logos all over things.

And since there is Atari Teenage Riot, that makes two bands that dig Atari.

Of course can be used, remember Turbo Basic, Superdos, Dos XE, Sparta Dos X and maybe some others... Also a couple of ramdisk handlers would let you use that area....

Javier.

/shame mode engaged/ I *own* the *S*S*S* record. Looks a bit like a transformers picture on the front, and on the back has the band members replete in cyber punk glory. Yana-Ya-Ya is the only one I remember off the top of my head! ! As well as wearing Atari shirts, the album has the track Atari Baby. ("I don't mean maybeeeeee, Atari babeeeeeeeee")

Every so often the Phillip the record player (banished to the garage) spins this vinyl while I'm out working outside.

If only I'd kept my video of Love Missile F1-11. It was a slightly different mix to the record, and it showed the band running around and being filmed by paparazzi IIRC "One say, the whole world will know my name....."

/shame mode disengaged/ return to real world/

Cheers,

.John E Cash

<Wipe mouth>

Cool stuff. Would anyone like to share with us EXACTLY how to use a pc modem through SIO2PC or APE
to get the A8 on the internet? Once you dial your ISP from the computer (or does SIO2PC do it with
the A8 R: handler?), what software do you need on the A8? I never used any comm software back in my
A8 heyday, so I'm not familiar with what's out there. Is there a DOC or FAQ already out that
explains all of this and tells what you need?

Thanks,
Steven

SIO2PC is extremely limited in the modem access capability. Ape, however is real strong. The limitation is that you'll only gain shell access (if you have such), and not a true TCPIP connection.

If you're not familiar with shell access, its simply direct command line UNix access to your ISP. From there, you can launch ftp, lynx (dos-like browser), telnet, gopher and newsgroup access via programs like TIN and PINE.

Have you ever cleaned the drive head ????
I own a 1050 and from time to time (when I used it frequently, now ape is
doing most of the work) I cleaned it's head, just like it was a
casssetterecorder head, so using pure alcohol (get it at a drugstore) and an
eartip (don't know how they are called in English)
Also the head slides over two metal bars (that is in the 1050) and every
ones a while I used to grease them, it made it sound a lot better !

>I saw a listing of the GTIA registers and saw ones for the H position
>of sprites. How do you control the Vertical location?

Hahaha, sorry but : You don't !
There _is_ no vertical location control on Atari 8-bit "sprites" (after all,
they are really called Player/Missiles).
Only solution is moving the player up or down "manualy".
One of the flaws on the 8-bit. They all are single color too !
But heck, this machine was designed in 1978 !!!!

> Is there more
>registers that were missing from the list maybe?

Well I guess not than !

I can't seem to find this original thread, so I'm reposting this header. My original question was asking if anybody still had the same Atari 8-bit software/hardware that they had when they originally got into the scene. I'm posting this message for Eric Sokolowsky...

<<Sender: esok@cs.byu.edu
To: swozniak@aol.com

I can't seem to post this article to the newsgroup, so I'm sending it to you. Please post it if you can.

I have owned an Atari 8-bit computer since about 1982 or 1983. My first machine was an Atari 400. Several months later, that machine died (I think the memory went bad or something), and we took it back to the store and got a replacement (it was still under warranty, thankfully). I still have that replacement 400. I also still have the original 410 tape drive and all the original cartridges I have ever got. My first cartridge games were Star Raiders, Qix, Space Invaders, Donkey Kong, and Mountain King. Since then, I have added two 1050 drives, an Indus drive, a Percom drive, an 800, several 130XEs, a 65XE, an XE GS, and one or two 800XLs. (No 600XL or 1200XL, though.) I've loved my Atari ever since I got that little 400, and I also really enjoy reading this newsgroup.>>

There you go, Eric. Your welcome. :)

5028. 1.44 on atari

5030. Emulators vs. the real thing

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-28 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <13790-356E35E9-3@newsd-199.bryant.webtv.net>
Source record: 62493

If I may be so bold...

Seeing some posts about how some Atari programs don't do this or that under emulation, or which version, blah blah blah, I was wondering this. Since one could get an XL/XE and a drive for a song (just check www.ebay.com), why even use an emulator? Why not the real thing, in 1.77 MHz 65C02 64k native mode?

Then one could just get a real Atari disk, instead of dealing with connecting cables and a (shudder) PC.

Just a thought.

5031. Mr. Robot and his Robot Factory- any codes?

Message-ID: <13790-356E3452-1@newsd-199.bryant.webtv.net>
Source record: 62494

Just the other day, I met one of the guys that did programming for DataSoft/DataMost. He was working for WebTV, and he asked me if I remembered any titles, and the first one I said was Mr. Robot, followed by Tail of Beta Lyrae. He got a kick out of that, and dared me to hum the music from Mr. Robot. When I did, he was really surprised that someone still remembers the old 8-bit stuff.

Anyway, I remember there used to be a code to go to any level in the game, and of course, I had forgotten it. So, does anyone remember it, or have it written down somewhere?

5032. HELP! Question about Shamus Cart and 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-28 00:00:00 UTC
From: "Eric R. Balch" <erbalch@adnc.com>
Message-ID: <6klkj2$98a$1@hops.adnc.com>
Source record: 62495

Hi all!

I just received a lot of cartridges from an auction and amoung them is Synapse Software's SHAMUS (It's in a cool red clear shell). Actually this cart was the reason I bid on the lot. One of my favorite's from the 80's!

Anyway, my question is there are two problems with the cart that I think are 1200XL related. I was hopeing someone here would have some helpful input.

Question One is simple: The cart will not insert into the cart slot on the 1200XL. This cart came out in '82 before the 1200 and it seems that it just won't fit. Does anyone else have this problem with any other Synapse carts??? Note: the way I was able to run the cart was to simple take the shell off -One screw only!-

Question two: Once I got the cart into the slot and booted the old 1200 I got the initial credit screen but no matter what I do... Press the JS button, Start, Option, Select... The game simply does nothing. It this one of the many 1200XL incompatibilities??? Is that sort of thing possible with a ROM Cart? I have yet to clean the contacts... Could that be the problem? Is anyone out there running this cart with a 1200XL?

Any help anyone can provide would be much appreciated!

Thanks,
Eric

To change the vertical position, the sprite had to be moved in memory.
You can change the base address of the sprite memory, But it all moves
and the address had to fall on a 256 byte boundry (i think?, i'd have
to go find my old atari tech ref manuals). The character set and
display memory were similar. The main gain in my opinion was the
collision detection, not the graphics.

Yup,

I have my original Atari 800/810 (810 needs an aligment though :( )

Since that time I've accumulated:

130XE(2), 800XL, 5 1050's(all work!, 1 is Happy Enhanced), 1010 and an XEGS
w/Light Gun!

I have numerous carts and such and play them all today.

Does anybody remember Adventure International?

Mountain Shoot? Scott Adams(not dilbet) Adventures? Star Trek 3.5?

Well I am trying to get some of the insert that were IN the bags the programs came in. With their crude drawings and all.

Mainly I would like the Scott Adams Adventures ones. If you have them, I would love to get the originals, or just good scans of them. Or even good color copies!

I am constructing a website witha section about the old AI stuff, and would like them for that reason.

PS - Scott Adams is alive and well, and has put his adventures into shareware and has ported them to Win95. Anybody want me to post them here?

Thanks

Bauhaus

Source record: 62499

Yes, sort of.
There was a German 1.44 drive that TTBOMK is no longer available.
A Black Box/Floppy Board will do a 1.44, but at least when I
checked about 2 months ago, there are no Floppy Boards
available. You might contact Bob Puff at CSS to see if he has
any plans to produce more.
There is also a good alternative. I use an internal SCSI ZIP
drive with my Black Box and regular Hard Drive. I love it -
100 meg per cartridge.
There are also several IDE interfaces apparently available now,
so that also makes it possible that an IDE 120 meg Super Floppy
might work.

Everything has been tested and works. This package includes an Atari 600XL computer (an 8-bit computer from the mid 1980's) with the user's manual, power supply, RF cable, switchbox, one standard Atari joystick, one set of paddles, and the following five cartridges: Mountain King, River Raid, Dig Dug w/manual, Defender w/manual, and Kids on Keys. Everything is in good cosmetic condition as well. Buyer prepays plus shipping. Thanks, Alex.

If that was posted as humor, then it worked. It brought tears to my eyes
:-)

OTOH, if it was posted as a serious reply to "Leave it on or turn it off?"
then its total crap. Not only have I never heard of this in 15+ years of
working with different hardware, but it has many holes in it. Hard drives
with vents? No such thing. Simply because they are sealed air-tight...any
dust specs on a hard drive platter is large enough to crash a drive because
the head travels so close to the platter that a single spec of dust can
crash the drive. Gunk on the head? Where does this gunk come from? Run
the drive at slow speeds??? Where do I find the speed adjustment on this
magic drive?

:-)

Ok ok a clarifier.... I was the one that originally responded "utter
crap" to the notion that leaving a drive on for a week, shutting down
for a weekend, then powering back up after the weekend is somehow very
risky. It isn't; done it for years with no failures. Then, I was
told my utter crap response was wrong. I stand by my notion there is
little to worry about. To complicate things... HDs _do_ have vents my

good fellow. They are NOT air tight. They do have a breather filter to prevent inclusion of dust. Moisture could gain entrance I suppose. The real hole in the heating up theory, as it pertains to running for a few days or a week, is that the drive reaches it's high temerature much quicker than that. The drive is at it's running temp easily within 1 hour of use. It gets no hotter after that, barring a failure of the case cooling system(s) or an increase in environment temp (room). But those circumstances are besides the point of discussion anyway. Also, the orininal poster claimed that the lubricants evaporate and then re condense on the platters. If lubricant were really evaporating to much of a degree, the rotational mechanics of the drive would fail after one long use and one power off. That doesn't happen in reality.

It's possible, and I would assume that Atari did a lot of outsourcing for designs, but Atari themselves released information about it's (then) upcoming Amiga chip. I've got several magazines from the '80s with press releases about it. I'll try to find them this weekend to get all the gory details, but essentially what happened was that Commodore paid the design guys more money to skip out on Atari, and Atari was forced to come up with a new design, which I believe was the Amy chip.

Again, this is going by a memory that is over 10 years old, so I'll try to find the mags to verify the real story.

Steven

Better yet, fire up an ftp client and go to ftp.gmd.de/if-archive

You can get all the Scott Adams stuff in the same format as the Infocom titles. There are interpreters to let you play all the Infocom (and AI) z-code files on just about every platform. There are even NEW titles out there, written by individual authors, and it's all FREEWARE. If you own any Infocom disks, there are converters there (ZCut is the one you'd need for PCs) to transfer Infocom disk images into the format that the interpreters will use.

Alas, no one yet has written an interpreter for the A8 computers. Tom Hunt hard-coded some z3 stuff into Atari files, which you can find via ftp at closertohome.dyn.ml.org, but there's no true general purpose z-code interpreter for Atari 8's yet.

If you own any of the Infocom rerelease CD-ROM's, which I think were Mac & PC based only, you can use the .dat files off the CD to play the games using any of the available interpreters. I used my SciFi Collection PC CD and all my Atari Infocom disks to get the .dat's for just about all of the Infocom titles. The AI stuff plays very similarly, but the parser is a bit weaker, of course.

Since Scott has made his AI stuff publicly available now, it's only fair to mention that you can get ALL of the AI games, including the SAGA titles, at ftp.hackerz.com (that is, when hackerz is actually up & running. As of this morning, it's running fine, but you never know). These are the actual disk images you can use to run through SIO2PC or APE to play them directly on your Atari.

Have fun!
Steven

There's something I've noticed about ZIP drives (at least the SCSI
versions) is that the computer's controller just sees it as a hard
disk that happens to be removable. Very handy for installing programs
here at school on multiple w95 machines.... no drivers needed.

Well, there are a lot of reasons for it, I'm sure, but here are mine:

I can't lug my A8 systems to work. When I have free time, it's fun to pull up the emu and play.

I don't have internet access with my A8s. It's very easy for me to download atr files at work, copy them to a floppy, take them home and use SIO2PC to play them on my real Ataris. Plus, I can check them out on the emu at work before I go home.

I don't have hard drives on my A8s. My 1050 drives aren't going to last forever, so I don't want to use them if I can help it. Modern storage (i.e. hard drives, 3 1/2" floppies, zip disks, etc.) are much more reliable than 5 1/4" floppies. I can put TONS of .atr files on one zip disk, let alone what can be put on a large hard drive! In that sense, the PC becomes a "hardware emu," but I know it's not the kind of emulation you're talking about.

Now, take that to the next level... If I can put it on my desktop PC, I can also put it on my laptop PC -- instant portable Atari! I've taken several trips where I've been able to play Atari games that I'd have never been able to have with me before. Admittedly, very few things actually LOOK right on an emu, but they're still playable.

Another use for emus is that I can take any text file from the A8 and print it out on the laser printer at work, which is great for docs and program listings.

I don't think anyone would dare claim that an emu is better than a real Atari, but I hope that gives you an idea of why some people use them.

Steven

Anyone ever make a map to shamus? Or develop any cheats??? I always
wanted to finish it but I'm not good enough. Case II i used to love
and finish but my paitence for it is not good enough anymore on the
emulators.
Oh yeah, and it seems to crash the emu alot.

5059. ATARI800 Emulator: Software Speech?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-29 00:00:00 UTC
From: EURO-ISDN@t-online.de

Hi!

Although ATARI800 (DOS) already is the best emulator available there is still something missing. Not a bug actually but a feature: SOFTWARE SPEECH. 221B BACKER STREET, KENNEDY APPROACH and GHOSTBUSTERS do support that - but not ATARI800. Does anybody know when this feature is going to be integrated?

The original palmtop computer! Atari Portfolio runs MSDOS programs and has built in organizer software to manage your contacts and appointments, as well as a text editor and lotus-compatible spreadsheet! This package includes:

* Atari Portfolio and manuals
* Portfolio AC adapter
* Portfolio Parallel port adapter (allows you to connect to a desktop PC or Atari and xfer data)
* 64k RAM storage card

All in excellent condition! Functional and collectible, this is a must-have item!

Buyer pays shipping. Payment to be made in advance via certified check or money order; no COD.

arfy@catch-22.org (Yogi) asked:

<<Anyone ever make a map to shamus? Or develop any cheats??? >>

You can map out the layout of the levels, but the items (keys, potions, etc.) are laid out randomly. I don't really know of any cheats for this game. (It does require skill to finish, even on Novice.) A strategy that I use (which I discovered way back in 1982 when I was 13) is to enter a room, then back up right to the edge where you entered and let the baddies come to you. If an unescapable hail of bullets is coming at you, you can just quickly leave the room and re-enter. Another thing I do is hold down the fire button (which locks you in place) and rapidly tap on the joystick in the direction that I want to fire. (This is easier with an Atari-type joystick rather than a Genesis-type gamepad.) I can still finish the game about half of the time that I play it. It is challenging, and a bit of luck is required with the question marks. (Some games you'll get more free guys than others.) Hopefully, something that I've written here will help somebody.

Uh, my mistake. That's not entirely true. I just checked out hackerz and the
only title I could still find there was Buckaroo Bonzai. The SAGA stuff used to
be there, I think, but it's missing now.

Ftp to closertohome.dyn.ml.org and you'll find a few more titles, but Tom's site
is slow and only supports 3 concurrent users (it's his home computer, from what
I understand), so be prepared to wait or not get in at all.

If you have a more up-to-date computer, then definitely go to
ftp.gmd.de/if-archive and get a z-code interpreter for your machine. You can
get z-code files of all of the AI stuff there, for sure.

Good Hunting!
Steven

I had an Atari 800 for many years and just discovered the wonderful
emulators for PC, fantastic!

I'm a little confused on formats though. I understand the disk images
are *.XFD and *.ATR and ROMS are *.ROM.

Are the *.bin files for the 5200 ?
What are the *.exe files?

I loved my Demon Attack game and found a 4K file DemonAttack.bin

How can I use this in the atari emulators; pokey, xf, atari800?
I'm stumped.

Thanks much,
John K.

I love this game! I still often play it after work to relax. A trick to remember is that you can avoid all horizontal enemy fire by lining yourself up vertically at just the right spot near the right or left edge of the screen where the bullets pass just above or below you except for one that comes right at your middle, which can be blocked by your own fire (knives or whatever they are...)

I got to the Red level once.....and only once. Never had the patience to try
again after I lost. Took tooo long to get through the black, blue, green levels!

As for the original 1200 question, Atari made a wisee decision to restrict the 1200
cart port to only fit Atari released carts screwing third party developers who
created some neat cartridges that worked in the 800!

07/10/97 People present by Mr. Foote. Defendant present.
07/10/97 Affidavit for Public Defender on file. Public Defender appointed
07/10/97 James Brinkoetter appointed for the defendant.
07/10/97 Status hearing set for 07/31/1997 at 09:00 in courtroom 9.
07/10/97 Defendant charged $200 public defender fees. Defendant to pay $30
07/10/97 every week commencing Friday, July 11, 1997.
07/10/97 ----------
07/31/97 People present by Mr. Foote. Defendant present. No appearance by

07/31/97 the public defender.
07/31/97 Petition hearing set for 08/29/1997 at 01:30 in courtroom 9.
07/31/97 People directed to give notice.
07/31/97 ----------
08/29/97 People present by Mr. Foote. Defendant present. Finding the
08/29/97 defendant is not paying public defender fees. Appointment of
08/29/97 public defender is vacated. Clerk to delete the public defender fees
08/29/97 charged on the Petition to Revoke.
08/29/97 Appearance/counsel set for 09/12/1997 at 09:00 in courtroom 9.
08/29/97 ----------
09/12/97 People present by Ms. Bolton. Defendant present. Final continuance
09/12/97 to retain counsel.
09/12/97 Appearance/counsel set for 09/26/1997 at 09:00 in courtroom 9.
09/12/97 ----------
09/26/97 People present by Mr. Sauer. Defendant present. Defendant indicates
09/26/97 he will represent himself. Cause allotted for hearing on the Petition
09/26/97 to Revoke and Terminate Probation.
09/26/97 Revoke probation set for 10/10/1997 at 01:30 in courtroom 9.
09/26/97 ----------
10/10/97 People present by Mr. Sauer. Defendant present.
10/10/97 Cause called for hearing on Petition to Revoke.
10/10/97 Evidence presented. Petition proven. Probation terminated
10/10/97 unsuccessfully. Cause called for new sentencing hearing. Fines,
10/10/97 court costs, and fees to remain in full force and effect. Defendant
10/10/97 sentenced to 30 days in the county jail. Stay on the jail sentence.
10/10/97 Time to pay set for 11/25/1997 at 09:00 in courtroom 9.
10/10/97 Defendant admonished if fines and costs are paid in full, the jail
10/10/97 sentence will be stricken.
10/10/97 ----------

Total fines paid: $490

I still have the original 800 I bought at a garage sale in 1985-13 years ago this weekend. It is in perfect working condition, and I even have it set up with my first XF551 for my mother to use to learn personal word processing.(She likes that keyboard best. So do I.) That machine came with a 410 recorder that I used for 3 1/2 years until the ff/rewind mechanism gave out (justifying the purchase of the XF551), 12 issues of Antic, and some Learning Programming tapes. All for $80. I stopped using the 800 in 1991 after upgrading an 800XL to 256K and going online. A former ACE of Syracuse member sold me his 320K 130XE power supply for $12 as a replacement early in 1994 and through in the XE, which had been soaked by water from an ice backup. I dried it out and it still works perfectly every day.

I only had enough money that first year to buy either a printer or a drive, but not both. I thought a printer would make the system more useful to me, so I bought an Atari 1025 from Lyco Computers. A paper jam bent one of the pins in 1990, and I broke one off trying to straighten it. Needing a replacement in a hurry, I bought another 1025 from ATV. A year later I found an 850 and a Gemini 10X at a sale, and sold the 1025's. Two years later I found an Epson LX800 and the Gemini became my backup printer.

My first "monitor" was a 10-inch B/W tv set, which I still have, but use as a tv again. I used a Gorilla green monitor(no audio) for a long time, and still have that around here someplace. I now use a Commodore 1701 color monitor on the XE and an 1801 on the 800.

My first modem was a SX212, which I still have, replaced by a Supra 2400 that originally ran the ACE of Syracuse Backstairs BBS. I lost that modem, the 850, the LX800, a 1040 STf, and another 2400 modem to a lightning strike in May 1996. The 130XE and XF551 were completely unscathed. The 850 was replaced with one given to me by someone leaving Atari behind. The Supra was replaced with a Hayes Smartmodem 2400, and later by a 1.44 modem of unknown brand. The LX800 was replaced with a Star NX-1001. Most things came from garage sales.

I still have all the original carts I bought here and there, and most of the disks. The tapes are here too, but I can't read most of them.

I'm not sure I understand. TTBOMK the BB is the scsi host.
The internal Zip model hooks right up to the BB. In my case, the
my Conner HD is the furthest on the chain, the Zip is the nearest.
From my experience, I had to have a "parity mod" chip added to the BB. This
was $20 from CSS.

I've been using this about a year with no problems. There are
a few caveats to using a removable drive that was intended for
another system. If you also have access to a PC with a Zip
drive it could make life easier for reformatting, etc. I do, but
I've had no need to go to my PC to use the Iomega Zip Tools
to correct anything yet.

Yeah I gotta agree on this post.. this was one of my favorite games, and dandy was great as well!! I also liked the crystal castles clone that allowed you to create levels as well..

Now how come cool stuff like that isn't available on the pc?? You'd think SOME of that creativity woulda survived..

Oh on a similar (but off topic) question, since I'm running atari emulators, what's the best c-64 emulator?? and what usenet groups apply, and where of course can I get files for them?? be nice to have the old 64 stuff as well...

I have an ER educational game FT.
The game is called LA QUETE DU GRAAL and comes on two tapes; it was released by Atari's French division in 1983/84.
It's an original game (not a translated title) and mainly an algebra revision aid; some portions of the game are in French.
The program has the original packaging: some sort of white plastic box with a typical Atari gray cover with the name of the program (nicely designed).

I also have two complete tape sets of Bruce Lee (Datasoft).
Not very original, but the boxes are more interesting, as everything is written in French.
Both of the boxes are in plastic (in average shape...); one of them is black and the other one is white.
The white box has an MCC logo; this company, based in Monaco, hence the M, was the distributor for some Datasoft titles in France.

Finally, I have a small catalog from Atari France for the 8-bit line (1983/84).
No illustrations, apart from the cover, but it features some info on NR cartridges!

I would really prefer trading; e-mail me if you have rare cartridges/tapes/disks/software boxes.
I would also trade my stuff for video games mags (Electronic Fun...).

Thanks for reading,
Bertrand.

>believe was the Amy chip.

Not quite...

After the 800, Atari didn't want to spend a dime on new computer development,
so Jay Miner left the company for greener pastures. He eventually got together
with some other guys to develop a new game machine/computer; the early
company was called Hi-Toro.

The early Amiga project was financed by two doctors, and things such as
joysticks (not to mention the joyboard, source of the "guru meditation";
it's also kinda fun to play games with, although difficult to control :).

As the computer progressed and the team ran out of money, Atari made some
ridiculously low offers for the company, but at the last minute Commodore
made a much more generous offer and they went with C=. With lots of new
cash they were able to finish up the computer we all know and love.

Note that Activision got a similar start -- Atari didn't want to pay its
programmers, so they left. Note also that the connection between the
Amiga and the Atari 8-bits was Jay Miner, who (at Atari) designed the
2600 chips and managed the 400/800 effort. Otherwise the design teams
really don't overlap (i.e. it's a stretch to say "The people who designed
the Atari 8-bit designed the Amiga").

For more Atari design info, the FAQ is a good start. For more Amiga history,
http://www.moa.sonnet.com/drc/amiga.html is a good page (including comments
from Jay Miner and RJ Mical), and http://www.cucug.org/ is always a good
place to look for info.

Activision's formation was also about recognition. Atari never credited
its game authors, but as you may remember, Activision's 2600 games always
said proudly on the box and the cartridge. "A game by David Crane" or "by
Bob Whitehead" or whoever else you like.

(somebody wants to read 'his old atari disks' on a pc.)
Can't be done, basically. You want to read single density disks
on your pc. Without a special controller, it basically can't
be done, or at least hasn't been done. I don't think so.

As opposed to one that doesn't work?

From the FAQ at http://www.faqs.org/faqs/atari-8-bit/faq/

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and
ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari
disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS
disks

To my knowledge NO Atari 8bit emulator can emulate digitized speech/sound
properly. (Try running the Antic Sample Processor and sampled music on
one of the emulators..)

And I don't think any of the emulator authors will get that feature
working..

but who knows....

Again, I'll ask.. I'm trying to use a Syquest SCSI2 EZ-135 internal removable drive in my Atari.

I'm using a BlackBox.. The scsi drive has 16 heads, 512 cylinders.

However, when I try to configure the BB for 16 heads, it puts a 0 in its place. It seems the BB will only go up to 15 heads.

Given this information, is there another formula for calculating heads/cylinders, or am I simply out of luck?

A PC can supposedly read 128 byte sectors, BUT it has to be MFM (as in
enhanced density, I believe). They just won't read FM (single density.) I
don't know how reliable the 128 byte sector read is, all I have ever done is in
D/D. And formating the disk
on the PC or an XF551 makes thing work much better.

I posted this ages ago but I think my ISP is up to its usual stuff on
the beta line :(

Try running the apma800 (a special version of Atari800 in the recent
archives) or Atariwin800. Both of those play the speech very well but
only on a fast machine so Petr told me (me 233MMX)

Berzerk, Whomper stomper etc sound damn good to me :)

I found that the Win version was the only one to play the Ghostbusters
intro properly?

You may find this interesting:

>For all CATWEASEL fans, the catweasl WWW-page address has changed.
>It is now .... http://members.tripod.com/~apd2/catweasl.htm
>please update your links ...
>Catweasel? What is a catweasel???? Read on.
>the Catweasel is a 8-bit card for PC (ISA) (and one for Amiga) which
>allows to read all kinds of floppy formats with standard 3 1/2
>and/or 5 1/4 floppy drives ...
>Read Amiga - Atari - C64 -- Apple Mac (even 800k!) - Apple 2 -
>and some more.. floppy formats n your PC!
>have a look at the web-page:
>http://members.tripod.com/~apd2/catweasl.htm
>If you have a floppy drive and disks of a format we haven't
>covered yet ... we may need you to send it so we can teach
>the catweasel new tricks.

5094. New Atari Site

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-31 00:00:00 UTC
From: David Wyn Davies <ansawdd@compuserve.com>
Message-ID: <01bd8c5d$9c91f420$3708e8c3@default>
Source record: 62407

Finally got off my big fat butt and started on my own atari web site.

It's nothing much at the moment but watch it grooow.

The Unfinished Projects page can be found at:

http://ourworld.compuserve.com/homepages/Ansawdd

Can't remember if it's all in lower case or not.

Regards,
David Wyn Davies

5095. FA - ATARI XF-551 5.25" Drive - ends 6/5

Well, I'm happy for a new Atari 8bit page but yours doesn't have much on it. Please post some pictures soon.

vs

5097. Re: Terry Ortman's rap sheet

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-31 00:00:00 UTC

Message-ID: <6kt272$a4o$1@newsd-124.bryant.webtv.net>
Source record: 62410

That's creepy, man. I read the part where he was penalized $200 for harassing phonecalls to Ms. Sayon. And saw where Terry was driving around without a license or whatever.

I wonder if he'll be posting those "For Sale: Atari 400, original price $599.00" in 2001.

vs

5098. New Mr.Robot game release?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-31 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <23960-35724ED4-19@newsd-199.bryant.webtv.net>
Source record: 62411

The simple reason is that there is still a copyright on the game.

However, the guy I talked to may have the rights to the game, and when he asked whether it would work now, I said, of course!

And, of course, the basic premise would survive, but enhance the graphics, keep the soundtrack, but jazz it up, and voilá!, Mr. Robot 1998!

If they could do it to Pitfall, they could do it to Mr.Robot.

5099. Re: WTB: Omnitrend's Universe

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-31 00:00:00 UTC

Source record: 62412

That sounds about right... I always got Omnitrend confused with the company
that made Paladin etc.
